Epistemic constitution of lifted mechanical solidarity

epistemic constitution of lifted mechanical solidarity *noun phrase* **Status:** proposed synthetic term **Fields:** social epistemology, sociology of knowledge, sociology of morality, moral and political psychology, cultural theory, institutional design, argumentation theory

Short explanation for busy readers

An **epistemic constitution of lifted mechanical solidarity** is the society-wide meta-order that governs how a plural modern society relates public life to truth. It determines which persons and institutions receive epistemic authority, what counts as admissible evidence, whether people may honestly express doubt and disagreement, how claims are publicly tested, how errors are corrected, how collective memory is preserved, and whether social belonging depends upon professing an authorized account of reality.

It is a **universally governing second-order order** and, under the single-slot principle, a **lifted full capture**. The shared binding force lies in rules that generate, select, apply, and revise concrete answers, not in one fixed catalogue of answers. Its generated outputs can include plural first-order jurisdictions; the persons, offices, professions, institutions, communities, and contracting parties beneath it can therefore remain differentiated and domain-limited even when the generator governs universally.

It is called **lifted mechanical solidarity** because citizens share an answer-generating meta-order. They can reach different first-order answers and live different religious, occupational, and personal lives while remaining bound by

how answers and authorities are produced and corrected. *Lifted* is a new extension of Émile Durkheim's distinction between mechanical and organic solidarity; it is not Durkheim's own term.

The concept is analytically modular. It uses *Culture Mechanics* to describe one implementation of the shared order, but its truth orientation can be evaluated directly through public avowal, authority, evidence, disagreement, attention, memory, and correction.

The document currently recognizes two independent **constitutional classification orientations**. Each has ideal-typical poles rather than claiming that an entire society receives one scalar score. The first is the **truth orientation**:

> A **reality-anchored, truth-seeking epistemic constitution** makes sincere disagreement visible and keeps every person, model, authority, and institution corrigible by mind-independent reality.
>
> A **systemic-lying epistemic constitution** recurrently generates, selects, authorizes, protects, and replaces organized un-reality because its correction relations subordinate independent truth to usefulness, loyalty, control, or authority; public speech, incentives, memory, institutions, and ordinary participation reproduce that inversion.

The second is the **life-drive–death-drive constitutional orientation**, which asks what the shared order organizes motivation to reproduce:

> The **life-drive pole** channels motivation through limits, reality-facing practice, and completable projects toward building, binding, repair, capability, relationship, maintenance, transmission, and posterity.
>
> The **death-drive pole** channels motivation into self-renewing circuits of repetition, negation, grievance, transgression, destabilization, or adversarial conflict, until repetition becomes a destination and begins to consume its carriers.

Most actual societies and institutions are mixed and may occupy different positions on different orientations and dimensions. A constitution may be truthful yet death-driven, or systemically lying while claiming life, peace, health, or flourishing. The two orientations therefore classify different properties and must not be collapsed.

The project-specific **theoretical *un-* family** marks deformations internal to X rather than simple absence or external opposition. It presently distinguishes **constitutive-relation inversion**, which directly reverses what answers to what, from **pseudomorphic governor substitution**, in which a durable social bearer retains X's recognizable form, machinery, and authority while an incompatible principle governs consequential choice, correction, and reproduction or succession. It is a restricted diagnostic construction, not the ordinary meaning of every word beginning with *un-*.

Within the truth orientation, **un-reason** names a proposed internal failure mechanism: inferential, conceptual, interpretive, or critical intelligence remains active, but a protected conclusion governs the evidence and correction to which it should answer. It explains how intellectual sophistication can strengthen rather than repair a self-sealing order. Un-reason is a constitutive-relation-inversion mechanism, not a third constitutional orientation or a bearer-level PGS diagnosis by itself.

Un-reality names a related cross-scale state or output: an authorized representation retains operative public reality-status and continues to classify facts, direct decisions, and allocate burdens, resources, permissions, status, or jurisdiction, while independent evidence and consequence can no longer reliably reduce its authority or revise its use. It is not a third orientation either. It requires social operation but not one bounded institution. Un-reason can help produce or maintain un-reality; a systemic-lying constitution is the larger meta-order that recurrently generates, selects, authorizes, protects, and replaces **organized un-reality**. After disclosure, an acknowledged false account can remain operative through **procession inertia**, while an independently defeated but unacknowledged account can persist through **correction nullification**: the correction is speakable but treated as though never received. **Procedural correction conversion** is the distinct case in which a correction is received and recorded but a procedural rule converts it into no operative defeat. **Bounded de-authorization** is the corresponding person-preserving response that withdraws specified operative authority without requiring conversion or whole-person defeat.

Suppression of nonviolent, evidence-bearing correction is a **non-localizing epistemic-constitutional fault sentinel**. It can strongly indicate that correction-protecting malfunction is present without identifying whether the cause is localized self-protection, un-reality, un-reason, organized un-reality, systemic lying, or another mechanism. A censorial law cannot acquit itself merely by making the targeted correction unlawful.

The wider ecology of Culture Programs, including pluralistic classical liberalism as a proposed lifted Culture Strategy that contains incompatible first-order programs, is defined in *Culture Program Ecology*. This document remains the semantic home of the epistemic constitution through which that containment preserves or closes public correction.

In its shortest form:

> **The epistemic constitution is the cultural operating system that determines whether society's shared world remains answerable to reality or reality becomes answerable to society's authorized story.**

It also determines whether the shared order permits motivation to complete, maintain, and transmit independently valuable goods, or makes renewable negation and conflict into its own reason for continuing.

Long semantic definition

1. General meaning

An **epistemic constitution of lifted mechanical solidarity** is the operative ensemble of second-order norms, sentiments, roles, authorities, institutions, incentives, procedures, communication practices, and everyday habits through which a differentiated society:

- distributes the authority to know, interpret, certify, teach, remember, and correct;
- establishes what may enter public consideration as evidence;
- shapes the relationship between private judgment and public avowal;
- makes some forms of trust, doubt, disagreement, and inquiry honourable and others shameful;
- converts dispersed observations and judgments into public knowledge or public appearance;
- preserves or destroys independent routes by which claims can be tested;
- rewards correction or protects institutions from correction;
- directs collective attention and memory;
- organizes what shared motivation is permitted to complete, maintain, reproduce, or oppose;
- and determines whether social authorization remains subordinate to truth or substitutes for it.

As a second-order meta-order it has universal jurisdiction over the constitution, allocation, limitation, interaction, succession, appeal, and correction of first-order outputs and jurisdictions. This is one application of its more basic form: installed meta-rules combine with current inputs and a situation to generate a binding answer. Plural institutions and ways of life are possible outputs, not the definition of lifting. The constitution fully occupies the cultural slot whether it is reality-anchored or systemic-lying; corrigibility must be assessed separately from order level, occupancy, and jurisdiction.

The word **constitution** is used functionally rather than narrowly legally. The constitution may partly be written into laws and formal procedures, but much of it is enacted through professional norms, schooling, media routines, prestige, sanctions, language, rituals, algorithms, reputations, and the anticipated judgment of others. It is what society actually runs, not merely what its formal declarations say it runs.

An epistemic constitution is therefore not a catalogue of officially correct propositions. It is the deeper order that determines:

> who may say what, through which channels, under which burdens, with which social consequences, subject to which tests, and with what possibility of correction.

This usage has a close contemporary neighbour in **Jonathan Rauch's** *The Constitution of Knowledge*, which describes a liberal social system for turning disagreement into knowledge. The present term is broader and not identical. It treats *epistemic constitution* as a neutral genus that can name truth-seeking and systemic-lying orders alike, and it connects that genus to Durkheimian solidarity, cultural formation, public sincerity, distributed enforcement, and the possibility of an entire society becoming organized around authorized un-reality.

2. Semantic anatomy

Epistemic **Epistemic** concerns the social production, communication, justification, testing, preservation, and correction of belief and knowledge. It includes empirical claims but is not limited to formal science. Historical memory, testimony, journalism, professional judgment, institutional records, public explanations, causal stories, and ordinary reports of experience all belong to the epistemic life of society.

Constitution **Constitution** means the relatively durable meta-rules by which epistemic life is organized. These rules allocate permissions, burdens, protections, jurisdictions, and sanctions. They need not have been designed by one actor. They may emerge recursively from many locally rational choices and then constrain the individuals who reproduce them.

These meta-rules may govern universally at their own level while generating particular answers and bounded authorities. The full definition, concrete cases, and difficult classifications remain in *Epistemic Agency under Mechanical Solidarity*.

The term should not be confused with **Michel Foucault's** *regime of truth*, developed in interviews such as "Truth and Power" in *Power/Knowledge*, although there is an important family resemblance. Foucault directs attention to the procedures, institutions, sanctions, and authorized speakers through which statements function as true. The present concept asks the additional realist and normative question: **does that social regime preserve independent ways for reality to defeat its authorized claims?** An epistemic constitution is therefore evaluated not only by how truth-status is socially produced but by whether the resulting order remains reality-answerable.

Mechanical solidarity **Mechanical solidarity**, introduced by **Émile Durkheim** in *De la division du travail social*, is cohesion through shared beliefs, sentiments, and the moral force of collective consciousness. Durkheim contrasts it analytically with **organic solidarity**, which arises through differentiation, specialization, and interdependence.

The present synthesis does not claim that modern society simply returns to undifferentiated mechanical solidarity. Modern society remains organically differentiated: physicians, engineers, historians, courts, laboratories, media, families, religious communities, firms, and citizens perform different functions and possess different knowledge.

When reporting Durkheim, this document preserves **organic solidarity** as his source concept of cohesion through differentiated interdependence. Within Culture Mechanics, however, the source composite is analytically decomposed: **organic differentiation** names the topology of specialized roles and reciprocal dependence, while **lifted mechanical solidarity** names the common binding force located in the rules that constitute, allocate, and correct those differentiated roles. This is a project reinterpretation rather than Durkheim's own formulation; its authoritative treatment is in *Epistemic Agency under Mechanical Solidarity*, "Durkheimian organic solidarity as a lifted composite".

Within the coordinated theory family, *Epistemic Agency under Mechanical Solidarity* further interprets mechanical solidarity as emergent symbolic-affective field coherence among local bigOthers, with back-action upon the people who sustain it. This document does not repeat or depend upon the physical analogies used to explain that mechanism. It takes the resulting second-order social order as its object and asks whether its epistemic constitution preserves or disables correction by reality.

Lifted **Lifted** names a proposed transformation of mechanical solidarity. Binding sameness moves from shared concrete rules and answers to a shared generator:

```
FIRST-ORDER MECHANICAL SOLIDARITY
members share concrete rules and answers R1, R2, R3 ...
                        ↓ lifting
LIFTED MECHANICAL SOLIDARITY
members share fixed M; current K_t and situation C generate binding R_t(C)
```

Fixed means operatively installed and binding, not eternal. Generator and output belong to one operative weave. The result often has less shared concrete content and greater reach because one generator can produce many answers. It can protect pluralism by making different outputs compatible with membership. It can also synchronize a society around a closed generator whose authorized procedure controls what may count as real.

Lifted therefore describes the order at which binding sameness resides, not incomplete occupancy, weak jurisdiction, pluralism, or moral quality. A lifted program fully occupies the single slot. Its generator may govern universally at its own level even while the outputs and representatives it constitutes are bounded. It can remain open and corrigible or become closed and pathological.

The phrase **lifted mechanical solidarity** is therefore an extension of Durkheim, not a term found in his work. First-order and lifted solidarity use the same field-forming mechanism in the present theory; *lifted* means that common binding force has moved from concrete answers to their generator. The detailed definition, examples, and boundary from organic differentiation remain in *Epistemic Agency under Mechanical Solidarity*.

At society scale, a lifted order can support **cultural interoperability**: the capacity of differentiated persons, communities, institutions, and symbolic orders to translate important meanings, recognize legitimate common procedures and jurisdictions, and coordinate required common action. This is a performance of the architecture, not the definition of lifting. *Mythology Construction*, "Cultural interoperability and its breakdown (Babelization)" distinguishes the meta-order's effective thickness, its span across interfaces, and the cultural-interoperability floor (anti-Babel floor). A lifted order may be nominal rather than operative, or too thin or narrow in span to keep a society above that floor.

High cultural interoperability also does not decide the separate **subjecthood-absorption** question. A universal epistemic constitution can preserve differentiated persons and bounded subordinate jurisdictions, or it can become closed and absorptive. Order level, occupancy, jurisdiction, corrigibility, interoperability, and subjecthood absorption must therefore be assessed separately.

3. Why the concept is an operating system

The operating-system metaphor identifies the level at which the concept works. An epistemic constitution does not itself contain all social knowledge. It governs how knowledge-producing and belief-forming processes obtain access, communicate, compete, record results, handle error, and recover from failure.

Like an operating system, the meta-order is universal over permissions and process boundaries while the processes remain differentiated. Universality at this level does not imply one central programmer, one institutional brain, or unlimited competence for any process or administrator.

Operating-system function	Epistemic-constitutional equivalent
Kernel	Mind-independent reality and its reserved capacity to contradict every model
Permissions	Domain limits on authority; rights to question, answer, inspect, and appeal
Processes	Persons, disciplines, institutions, professions, communities, and inquiries
Interfaces	Public language, media, education, testimony, reports, debates, and records
Sensors	Observation, experience, disagreement, failed predictions, adverse outcomes, and anomalies
Logs	Provenance, evidence, decision reasons, minority reports, predictions, corrections, and institutional memory
Fault isolation	Independent sources, institutions, methods, and causal routes that reduce common-mode failure
Recovery	Retraction, reconsideration, appeal, replication, model revision, and honourable mind-changing
Resource management	Stewardship of finite public attention and resistance to informational flooding
User protection	Dignity, cognitive liberty, due process, legitimate dissent, and practical possibilities of exit

The metaphor must not imply a central programmer or a single institutional brain. The epistemic constitution is distributed. Its implementation uses several levels defined more fully in *Culture Mechanics* and *Epistemic Agency under Mechanical Solidarity*:

Core construct	Limited function needed here
Lacan's big Other	The shared symbolic order and, in the present functional translation, the on-the-wire protocol of language, law, roles, conventions, master signifiers, and recognized symbolic authority. This does not exhaust Lacan's concept.
Local bigOther	The individual sentiment classifier that executes an installed mythological lens and makes approval, shame, legitimacy, loyalty, and exclusion affectively operative.
Mechanical-solidarity field	Emergent coherence among compatible local bigOthers that acts back through public expectations, sanctions, institutions, and apparent consensus.
Distributed bigOther	The dynamically maintained symbolic-affective network state reproduced through local bigOthers, institutions, roles, practices, stories, and artifacts.

Core construct	Limited function needed here
Multi-mind-self	The distributed system only when it becomes sufficiently integrated and continuous to qualify as a collective agent. An epistemic constitution does not require every society or institution to pass this threshold.

The spelling *bigOther* marks the culture-mechanical adaptation; it should not be attributed to Jacques Lacan. These distinctions specify the implementation interface without making the truth/systemic-lying analysis depend upon the full homo-duplex architecture, field analogies, privileged programming topology, or collective-ownership hypothesis. An epistemic constitution can be described and evaluated by its rules of authority, avowal, evidence, disagreement, memory, attention, and correction even where those deeper mechanisms remain disputed.

For the mapped features and limits of the operating-system picture, and its relationship to the framework's CPU, PCI-slot, protocol, field, laser, magnet, and braiding models, see *Analogical Models in Culture Mechanics: A Semantic Inventory*. That optional inventory does not alter the definition or tests stated here.

The constitution is installed when people learn not only propositions but sentiments such as:

- whether asking an elementary question is responsible or insolent;
- whether disagreement signifies integrity or betrayal;
- whether checking an ally's claim is honourable or disloyal;
- whether uncertainty signifies honesty or weakness;
- whether correction earns respect or humiliation;
- whether an accusation demands evidence or immediate alignment;
- whether an institution's prestige supplements evidence or replaces it.

Constitutional scripts: the meta-order made executable A written rule or verbally shared principle does not by itself make the epistemic constitution operative. The lifted generator becomes effective in recurring situations through **situated cultural scripts**: distributed, role-, institution-, and situation-indexed adapters that translate the general meta-order into detailed expectations, procedures, interfaces, permissions, and error recovery.

Constitutional scripts are the epistemic and civic members of that broader class. They specify, for example:

- how a person raises a consequential doubt without surrendering membership;
- how an expert marks uncertainty and corrects a previous statement;
- how a whistleblower, editor, auditor, court, laboratory, or public body receives and processes contradictory evidence;
- how an accused person answers and appeals;
- how a defeated officeholder concedes, transfers authority and records, enters opposition, and may later return;
- how an institution preserves an opponent's standing while rejecting the opponent's claim or programme; and
- how dormant contestability becomes active when a new disagreement or failure appears.

```
shared epistemic meta-rules M
+ role or institution R
+ recurrent situation C
+ current evidence and resources K_t
→ constitutional script S_R(C)
→ situated conduct, interface, record, and correction
```

The script is a generated and embodied first-order implementation of the meta-order, not the definition of lifting and not a second bigOther. Several compatible scripts can assign different tasks to citizens, experts, journalists, courts, agencies, parties, and officeholders while the same lifted generator governs their standing, jurisdiction, interfaces, succession, and correction.

This distinction makes **nominal** and **operative** constitutional order easier to separate. A rule can remain in a statute, manual, or public creed while the script for enacting it becomes de-animated, unsupported, contradictory, or culturally lost. Conversely, a local script can be defective even where the general meta-rule remains sound. Diagnosis must therefore distinguish failure of the constitution, failure of its institutional adapter, failure of a particular enactment, and absence of material or organizational capacity.

4. The recursive culture-mechanical cycle

The epistemic constitution forms individuals, and individuals reproduce the epistemic constitution. The causal structure is recursive:

```
SECOND-ORDER NORMS, INSTITUTIONS, STORIES, AND SANCTIONS
                              ↓
form expectations, trust, sentiments, and habits in persons
                              ↓
CONSTITUTIONAL SCRIPTS TRANSLATE META-RULES INTO
ROLE-, INSTITUTION-, AND SITUATION-SPECIFIC CONDUCT
                              ↓
PERSONS SPEAK, WITHHOLD, CHECK, FORWARD, CONFORM, OR DISSENT
                              ↓
their visible conduct becomes social evidence for other persons
                              ↓
apparent consensus, public memory, institutional legitimacy,
and the cost of disagreement change
                              ↓
the altered public environment forms the next round of persons
                              ↻
```

In the core vocabulary, visible conduct is encoded through the shared symbolic protocol, reproduced as part of the distributed bigOther, and returned to persons as field back-action. The **epistemic constitution is not identical with that field**. It is the comparatively durable epistemic rule-pattern carried by the field and its institutions: which signals receive authority, which contradictions remain admissible, which memories persist, and how correction occurs.

No conspiracy is required. An epistemic constitution can arise through ordinary socialization, coordination, career incentives, reputational concern, information overload, sincere belief, institutional inertia, and people's reasonable need to rely on others. Deliberate actors can nevertheless exploit the same mechanisms.

This is why small individual acts matter constitutionally. A forwarded claim, concealed doubt, ritual affirmation, honest correction, elementary check, or refusal to repeat a statement can alter the public signal to which others respond.

Desire, fantasy, and the formation of epistemic demands An epistemic constitution governs more than the circulation of propositions. It also shapes how open motivation becomes a demand for knowledge, recognition, certainty, disclosure, vindication, or correction. *Mythology Construction* adopts **constitutive lack** as an optional Lacanian motivational hypothesis: lack supplies a persistent gradient, **desire** remains open, and **fantasy** organizes what becomes desirable and what the subject imagines themselves to be for the Other. A mythology may then supply culturally intelligible objects, authorities, enemies, identities, and roles through which that fantasy is staged. None of these terms replaces the local bigOther, the installed mythological lens, or the distributed field.

The epistemic branch occurs when open desire receives an actionable direction:

```
optional constitutive lack
        ↓
open desire for understanding, recognition, certainty, or significance
        ↓
fantasy organizes a desirable object and subject position
        ↓
mythology and institutions supply available claims, roles, and authorities
        ↓
finite operational demand OR renewable epistemic demand
```

A **finite operational demand** has an observable satisfaction condition. In epistemic life it may ask:

- Did the experiment reproduce?
- Which causal model predicted the result?
- Was the quotation authentic and complete?
- Did the institution meet the declared target?
- Which stated disagreement did the new evidence resolve?

Completion is allowed to count as completion. The answer may open a later question, but the original demand does not need to remain alive to preserve identity, belonging, or status. Desire can move toward another problem without representing the previous inquiry as a promise of final psychic fullness.

A **renewable epistemic demand** appears answerable while its fantasy, institutional incentives, authority relations, or drive circuit prevent evidence from terminating it:

```
failure to obtain X
→ obstruction, concealment, or insufficient commitment proves the demand

obtaining X
→ X was incomplete, compromised, or only one layer of the hidden problem
→ successor demand
```

The fantasy can assign the participant a sustaining subject position: the persecuted truth-teller, indispensable revealer, uniquely lucid dissident, authorized guardian, or injured person whose recognition would indict the whole order. Factual correction can then leave the position intact or even confirm it: denial by others becomes evidence that the subject is the person they must fear or silence.

This is not a constitutional warrant to diagnose or regulate private fantasy. The public problem begins when a fantasy-supported demand governs shared attention, evidence, authority, accusation, sanction, or jurisdiction while remaining insulated from observable completion and correction. A reality-anchored constitution therefore asks:

- What exact proposition or demand is publicly at issue?
- What observation would satisfy, revise, or terminate it?
- Which identity or role is rewarded by keeping it unresolved?
- Does contradictory evidence alter the claim, or merely intensify the subject position and enemy explanation?
- Can the person retain standing if the demand ends, the claim fails, or the institution no longer needs their revelatory role?

5. Epistemic dependence without epistemic surrender

Modern people cannot verify everything personally. **John Hardwig's** "Epistemic Dependence" argues that rational knowledge often depends essentially on other knowers. **Patrick Wilson's** *Second-Hand Knowledge* explains *cognitive authority*: why some people are recognized as proper influences on what others believe. **Linda Trinkaus Zagzebski's** *Epistemic Authority* develops a positive account of rational authority and epistemic preemption.

The present synthesis borrows from these sources but makes a distinction they do not formulate in this exact way:

> **Reliance:** "This person's or institution's judgment is important evidence that I should normally weight heavily."
>
> **Reality-permission:** "This person's or institution's judgment determines which evidence I am permitted to recognize."

The first can be rational epistemic dependence. The second is **authority-gated belief updating**, the proposed pathological term defined in *Epistemic Agency under Mechanical Solidarity* for the point at which authorization begins to govern admissibility before content is examined. This document applies that person–authority mechanism at constitutional scale; it does not redefine it.

A reality-anchored constitution does not abolish expertise. It makes authority:

- domain-limited for particular persons and institutions within the universal meta-order;
- earned and track-record-sensitive rather than purely status-conferred;
- transparent about source, method, uncertainty, and conflict of interest;
- open to criticism from independent causal routes;
- able to coordinate action without claiming ownership of empirical truth;
- corrigible without requiring institutional self-destruction.

The central constitutional maxim is:

> **No person or institution receives root access to reality.**

This maxim limits representatives, not the scope of the constitution. Universal meta-jurisdiction determines how authority is allocated and corrected; it does not give parliament, a court, an expert body, or any other representative universal epistemic competence or the power to make reality answer to its certification.

6. Sincerity precedes collective truth-seeking

A person may sincerely express a false belief. Conversely, a person may insincerely repeat a proposition that happens to be factually correct. Public sincerity and objective truth are therefore distinct dimensions:

	Proposition tracks reality	Proposition does not track reality
Sincerely expressed	Knowledge or truth-tracking belief	Honest error
Insincerely expressed	Correct conformity or strategic assent	Deception, false compliance, or lying

The first constitutional task is not to certify the speaker's belief as true. It is to preserve fidelity between public avowal and private judgment so society can discover what its members actually observe, believe, doubt, and misunderstand. Only then can those sincerely represented beliefs be tested against reality.

This yields a two-stage principle:

1. **Avowal fidelity:** let people truthfully say what they think is true, false, doubtful, or unknown.
2. **Reality fidelity:** expose those sincerely expressed judgments to evidence, criticism, experience, prediction, and correction.

In compact form:

> **Say what you actually believe; submit what you believe to reality; truthfully say what you believe after reality changes it.**

Timur Kuran's *Private Truths, Public Lies* supplies the central micro-to-macro mechanism of **preference falsification**: public expression can diverge from private preference under social pressure. His analysis also connects falsified public performance to impoverished public knowledge and hidden political fragility. The present framework extends Kuran's problem from preferences to the broader sincerity conditions of public epistemic life.

The resulting pathological loop is:

```
private doubt
→ fear of reputational or material penalties
→ public conformity
→ appearance of consensus
→ stronger pressure on remaining dissenters
→ concealment of evidence and arguments
→ corruption of public knowledge
→ altered private knowledge and socialization
→ deeper conformity or an unpredictable preference cascade
```

Public conformity thus corrupts what may be called **public epistemic telemetry**: the signals through which society tries to perceive its own distributed observations and judgments. This expression is proposed here; it is not Kuran's term.

7. Living within the lie and ordinary participation

The systemic-lying pole is sustained not only by authors of official falsehoods. It depends upon ordinary people repeatedly acting as if the authorized representation were true.

Václav Havel's *The Power of the Powerless* describes "living within a lie": public ritual and conformity reproduce a system even when participants do not believe its claims. **Aleksandr Solzhenitsyn's** "Live Not by Lies" formulates the individual refusal to let organized falsehood operate through one's own speech and conduct. **Lisa Wedeen's** *Ambiguities of Domination* analyzes public dissimulation in which citizens act *as if* they revere claims widely understood to be fictitious. **Hannah Arendt's** essays collected in *On Lying and Politics* examine factual truth, political lying, self-deception, and organized deceit.

These authors are antecedents, not co-authors of the present term. They illuminate a constitutional principle:

> A systemic lie becomes a social order when people need not believe it privately but must orient public action, speech, and status as though it were true.

Rod Dreher's *Live Not by Lies* later borrows Solzhenitsyn's title and applies lessons from Christian dissidents to his own diagnosis of contemporary soft totalitarianism. Dreher is relevant to dissident formation and the social cost of truthfulness, but neither his political diagnosis nor his theological commitments define the regime-neutral concept developed here.

8. Truth as reality's reserved right of correction

The positive pole affirms that something exists independently of authorization, discourse, and collective preference. Objective truth is the regulative target, although human access to it remains fallible, partial, socially distributed, and corrigible.

The theory develops reality correction through this model-centred control loop:

```
experience and observation
→ concepts and operations
→ models or "digital twins"
→ predictions and interventions
→ encounter with mind-independent reality
→ surprise, error, and out-of-sample consequences
→ revision of models, concepts, or operations
```

The epistemic constitution generalizes this correction loop beyond formal science. Institutions, historical narratives, causal stories, policies, public accusations, and everyday beliefs must also remain exposed—by methods proportionate to their subject matter—to disconfirming evidence and real consequences.

Truth-seeking therefore does not mean that one institution already possesses Truth. It means preserving reality's ability to say **no**.

> **Objective truth exists, but no person or institution is identical with it; therefore the collective search for truth must remain plural, testable, and corrigible.**

This is the meaning of **reality-anchored**: not that every current belief is correct, but that the social order acknowledges an external referee that cannot be finally overruled by authorization.

Culture-propagator correction projection The culture propagator models the coupled evolution of representations, persons, collective field, institutions, consequences, sensing, and memory. This document owns the world–sensor–correction projection: how resistant consequences w_t become available observations y_t through a sensing architecture s_t, and whether those observations can revise operative representations r_t, institutional carrying structure k_t, and retained memory m_t.

The relevant relation is not simply world → belief. It is:

```
operative representation and authorization
→ person-level conduct and institutional enactment
→ worldly and relational consequences
→ detection, elicitation, classification, recording, and transmission
→ publicly available observation
→ challenge, answer, adjudication, and revision or non-revision
→ altered representation, operation, and retained memory
↻
```

Sensors are causal parts of this loop. They include instruments and datasets but also witnesses, categories, reporting routes, archives, professional methods, public records, affected-person testimony, comparison jurisdictions, appeals, and institutions able to preserve an adverse result. Observation is therefore neither raw reality nor arbitrary construction. It is a typed output of resistant conditions and the fallible social architecture through which they become available for correction.

Sensor endogeneity asks how much the apparent evidence was elicited, selected, classified, or produced through the contested representation, institutional response, and observation apparatus. **Correction independence** asks whether sufficiently independent persons and procedures can expose error, adjudicate it, and change consequential operation without first obtaining the tested custodian's permission. These remain separate: a partly endogenous series can be responsibly interpreted, while an independently gathered result can still be nullified after reception.

A representation is **performative** in this model when its deployment helps alter the object from which later evidence is drawn:

```
representation or prediction is deployed
→ persons and institutions respond
→ access, incentives, monitoring, conduct, and expectations change
→ the relevant population or environment changes
→ later observations concern the changed object
```

Performativity is not inherently deceptive or pathological. Policy, education, contracts, warnings, diagnoses, and public promises commonly aim to change conduct. The epistemic failure begins when the resulting observation is treated as though it arose independently of the deployed representation, or as though it uniquely validated a complete causal and normative package.

This produces **endogenous confirmation** where an operative representation helps generate an observation and that observation is returned as apparently independent support while the dependence or serious rival mechanisms are concealed or discounted:

```
representation R becomes operative
→ R changes conduct, institutions, or sensing
→ the changed response materially contributes to observation O
→ O is cited as evidence for R
→ O's dependence on R is omitted or treated as uniquely validating
```

The observation can be real and the representation partly correct. The three claims remain distinct:

$$\text{O occurred} \neq \text{R independently predicted O} \neq \text{the complete programme containing R is uniquely validated}.$$

Endogeneity does not make every intervention-produced observation evidentially empty. A predeclared conditional prediction can receive legitimate support where the intervention, comparison, causal path, expected timing, observation process, and serious rival mechanisms were specified in advance and the result could have failed. What it supports remains the tested conditional relation, not every classification, remedy, jurisdictional claim, or normative conclusion packaged with it.

Representations also travel in packages. An experienced condition or complaint, its classification, a causal attribution, a proposed remedy, a jurisdictional claim, an implementing authority, and a judgment about dissenters are separate inferential joints. Support for one does not carry automatically across the others, while rejection of the package does not erase the original observation or the affected person's standing.

Religious symmetry supplies a useful boundary test. Some Muslim apologetic arguments appeal to the Qur'an's preservation and transformative fruits; analogous arguments concerning Joseph Smith, the Book of Mormon, and the Latter-day Saint movement appeal to memorization, disciplined practice, sacrifice, missionary work, institutional formation, intergenerational transmission, and experience interpreted through scripture. Those effects can establish genuine person-actuating and culture-forming efficacy. Where incompatible revelation claims generate analogous fruits through analogous social machinery, however, the fruits do not by themselves discriminate between the exclusive supernatural claims:

$$\text{causal efficacy} \neq \text{epistemic truth}, \qquad \text{successful social embodiment} \neq \text{independent validation}.$$

This symmetry test refutes neither religion as a whole. It limits what deployment-produced transformation, endurance, preservation, and testimony can prove; historical claims, independently risky predictions, and other evidential relations retain their separate source-critical and empirical gates.

Because no social sensor is culture-free, the practical target is not impossible viewpoint-free observation but an **independent correction remainder**: observations, testimony, comparisons, and consequences that the tested representation–institution complex cannot completely elicit, select, classify, interpret, and adjudicate by itself.

The minimum correction-capable architecture therefore preserves pre-intervention baselines, versioned categories and denominators, plural causal models, exposed predictions and stopping conditions, portable records, independent comparison, protected testimony, usable appeal, and traceable propagation of correction into rules, appointments, resources, and succession. These are dynamic relations, not institutional checkboxes: their presence matters only where an adverse result can survive reception and change operation.

Resistant reality can keep imposing costs while losing corrective force at several distinct points:

Observation-path failure	Dynamic effect
Selection	Adverse observations are not collected, connected, surfaced, or retained.
Reclassification	Failure becomes sabotage, exception, impurity, insufficient implementation, or further evidence of the original problem.
Proxy substitution	A controllable administrative measure replaces the consequential outcome it was meant to indicate.
Cost displacement	Burdens move to weakly represented persons, another jurisdiction, or a later period outside effective feedback.
Custodial closure	One ecology controls definition, implementation, measurement, interpretation, adjudication, and whether an adverse result changes operation.

An accurate measurement of its selected and classified object can therefore remain misleading about the underlying incidence or consequence. The controller chain must be mapped from definition and implementation through access, sampling, publication, adjudication, and operational response rather than treating formal review as an independent error signal by default.

Correction capacity must itself be culturally reproduced. Persons, collective expectations, institutions, and memory must continue to make it intelligible and honourable to preserve an embarrassing record, expose a favoured claim to a reciprocal test, protect a correction bearer, surrender failed authority, and repair injury caused by a defeated representation. Correctors, record keepers, builders of independent instruments, and authorities who relinquish a failed policy are therefore reproductive roles rather than decorative moral examples.

Free speech and independent association are dynamically distinctive because they let a person formulate a rival account without incumbent permission, find other correctors, preserve evidence, test the claim, and organize consequential opposition. Permission to utter words is insufficient where publication, discovery, record custody, association, adjudication, or operational uptake is disabled. The same boundary prevents truth-seeking institutions from identifying themselves with truth and redescribing criticism of their custody as hostility to truth itself.

The me–we–world correction relation The **me–we–world correction relation** distinguishes three questions that a claim of impartiality can otherwise compress into one:

1. **Me:** Does the judgment survive removal of private or factional privilege?
2. **We:** Which collectively learned concepts, distinctions, methods, authorities, and standards made that judgment appear natural or necessary?
3. **World:** What encounter, operation, prediction, or consequence could revise not only the answer but the shared way of producing answers?

The first question uses the remove-the-me test: would the same rule and justification survive if the persons or occupied positions were exchanged while materially relevant structure remained? Passing that test can remove "because it is me or mine" as a justification. It does not remove the conceptual frame shared by everyone performing the test.

> **Removing the me may reveal the we, not yet the world.**

A judgment can therefore be genuinely impersonal relative to participants' private interests while remaining partial to their common starting framework. Private differences can cancel while an inherited category, prior, method, thought style, or source hierarchy remains invisible precisely because every participant uses it. Collective impersonality is an achievement beyond private-position privilege; it is not yet proof of fit with the nature of things.

Aquinas, Durkheim, and Rousseau: collective impersonality is not yet objective adequacy Aquinas supplies a precise predecessor for the world-facing side of this distinction. In *Summa Theologiae* I, q. 16, a. 1 and *De veritate* q. 1, a. 1, he receives and develops the correspondence account conventionally expressed as ***adaequatio intellectus et rei***: the conformity or agreement of intellect and thing. For a human judgment to be true, the intellect must apprehend the thing as it is. Agreement among judges, sincerity, authority, or collective acceptance cannot substitute

for that relation. Aquinas embeds this principle in a wider metaphysics of created and divine intellect; Culture Mechanics receives the narrower correspondence boundary, not that metaphysics as a whole.

Durkheim makes the social-epistemic complication unusually explicit in *The Elementary Forms of the Religious Life*. Collective concepts can establish harmony among minds, lift thought beyond private sensation, and preserve accumulated distinctions that no isolated person could generate alone. Durkheim expressly denies that concepts are collective because they average the corresponding individual representations. If that were their source, he argues, they would be poorer than the individual representations; instead, they contain knowledge that "surpasses the knowledge of the average individual." A civilization supplies an organized system of concepts enriched by accumulated group experience, while each present member assimilates only part of that inheritance and encounters particular objects through it. In Culture Mechanics terms, this is a **diachronically accumulated and distributed conceptual grammar**, not a poll result, a current population average, or a separate collective processor. That interpersonal achievement is not identical with harmony between thought and the nature of things. Durkheim's **harmony with things** is treated here as **objective adequacy**: the world-facing requirement that collective thought fit what it purports to know rather than merely coordinate the persons who use it. "World-fit" is the compact Culture Mechanics term for this requirement, not Durkheim's own technical expression.

The resulting boundary can be stated compactly:

> **Harmony among minds is not yet *adaequatio intellectus et rei*.**

Aquinas supplies the truth criterion: intellect must conform to the thing. Durkheim supplies the formation problem: the concepts through which persons approach things are socially formed, and their collective authority can either support or obstruct objective adequacy. Culture Mechanics supplies the correction architecture: a distributed epistemic milieu becomes world-answerable only where encounters, operations, predictions, consequences, affected persons, and rival accounts can revise both an answer and the shared grammar that produced it.

Durkheim sometimes treats generalization, persistence, and recurrent experience as guarantees that a collective representation cannot be wholly inadequate to its object. In the same discussion, however, he says that a scientifically sound concept can fail to become believable when it conflicts with the mass of accepted collective representations. He later describes society as a particular subject with its own idiosyncrasies, so its representations retain subjective elements that must be progressively removed if thought is to approach reality more closely.

Culture Mechanics receives Durkheim's social-formation insight while narrowing his persistence inference. A representation's endurance can evidence successful reproduction, usable coordination, partial environmental fit, or repeated verification under the conditions its community actually encounters. It does not by itself establish objectivity: adverse costs may be delayed, buffered, misattributed, hidden by the available categories, or shifted onto persons who lack power to enter the common record. Persistence is therefore evidence to explain, not a truth oracle.

Bewährung through corrigible reality contact

The stronger alternative to mere persistence is ***Bewährung* through corrigible reality contact**: a claim, rule, practice, or shared epistemic grammar acquires defeasible evidential weight by remaining viable under encounters in which its errors could become visible and operative. Age supplies opportunities for such testing; it does not establish that testing occurred.

The required sequence is:

```
claim, rule, practice, or shared grammar
→ application across materially varied conditions
→ independently resistant objects and consequential outcomes
→ preserved error signals and affected-person testimony
→ criticism, rival comparison, revision, rollback, or abandonment
→ renewed exposure
```

The German mnemonic ***Wir irren uns empor***—"we err our way upward," attributed there to Gerhard Vollmer's 1995 Popper memorial essay—names the error-driven direction of this loop. It does not describe an automatic or monotonic law of progress. Learning can stall, reverse, discard adverse records, reproduce a common-mode error, or reintroduce a failure whose correction history has been forgotten.

***Bewährung* is therefore correction-tested robustness, not survival alone.** A practice that persists because its costs are hidden, externalized, delayed, misclassified, or imposed upon persons denied standing has not passed this test merely by enduring. Nor does epistemic or practical *Bewährung* by itself establish moral legitimacy: a

workable arrangement can remain person-consuming or life-destructive, so the independent person-preserving and life-supporting constraints continue to govern what may enter the adaptive search.

In the me–we–world relation, *Bewährung* is the diachronic test history through which objective adequacy can acquire defeasible support. *Adaequatio intellectus et rei* states the truth relation, Durkheim's harmony with things distinguishes it from harmony among minds, and *Bewährung* asks whether a socially formed account has repeatedly remained open to being corrected by the things and consequences to which it claims adequacy.

Rousseau: cancellation can leave the shared frame untouched

Rousseau supplies a different but complementary source boundary in *The Social Contract*, book II, chapter 3. He distinguishes the general will from a mere will of all and proposes that, under demanding conditions, opposed private differences can cancel so that a common-interest component remains. The Culture Mechanics extension asks what the cancellation procedure cannot test: a category, prior, source hierarchy, or reasoning grammar common to all participants will not cancel, whether it fits the world or not. Rousseau's faction and independence cautions partly protect the procedure from correlated interests; they do not make aggregation an independent test of the shared frame itself.

The Durkheimian and Rousseauian operations must therefore remain distinct:

	Durkheimian collective concepts	Rousseauian cancellation and the project center-of-gravity image
Primary operation	Historical accumulation, organization, transmission, and partial assimilation of conceptual resources	Cancellation of opposed private differences under demanding political conditions
Result	A shared conceptual grammar that can exceed the knowledge of an average present member	A proposed common-interest component; the center of gravity pictures the shared frame or attractor around which private positions vary
Impersonality achieved	Thought can use concepts not produced from one person's private sensations or experience	A rule or judgment can cease to privilege one present person or faction
Unresolved boundary	The inherited conceptual system can retain the idiosyncrasies of its society and fail objective adequacy	A premise shared by all participants does not cancel and need not fit the world

The related **center-of-gravity** image is a project-developed explanatory analogy, not Rousseau's technical term, a literal arithmetic average, or the world. It pictures the common reference frame or attractor around which private differences can vary. Even in that non-arithmetic sense, it does not represent Durkheim's account of accumulated conceptual content that exceeds the average member. What feels cold, distant, rational, or impartial to a participant may therefore be the locally normalized operation of that frame—the *we* embodied in a distributed epistemic milieu—rather than a view from nowhere. The absence of a felt command or private advantage is evidence about how fully the procedure has become ordinary; it is not yet evidence that its categories are culture-transcendent or correct.

This is the precise boundary of **felt impartiality** here. The participant may experience no pressure from a concrete person, no obvious private gain, and no collar-like surge of shame or loyalty because the local epistemic grammar already determines what a competent observer is expected to notice, compare, and count as a reason. The epistemic cloud then becomes phenomenologically transparent: "this is how our trained community reasons" is experienced simply as "this is how reason works." That experience can accompany a genuinely fair and disciplined procedure, a locally partial thought style, or both. Its felt coolness therefore establishes neither falsehood nor objectivity.

Foucauldian genealogy, deconstruction, and Critical Constructivist inquiry can be valuable at this *me–we* boundary when they expose the historical formation, institutional authorization, exclusions, and hidden presuppositions of what had appeared neutral. Culture Mechanics accepts that diagnostic possibility without treating genealogy as refutation or social mediation as truth relativism. After the *we* has become visible, the separate *we–world* question remains: which shared operations, predictions, consequences, affected persons, and rival accounts can make the inherited grammar lose?

The three achievements must therefore remain distinct:

Achievement	What has been reduced	What remains untested
Positionally impersonal judgment	Privilege attached to *me*, *mine*, or my occupied position	The collectively shared frame and its fit with the world
Collectively or procedurally impersonal judgment	Dependence upon one person's private sensations, vocabulary, or idiosyncratic method	Correlated cultural premises, inaccessible alternatives, and world-fit
World-answerable objectivity	Neither social formation nor fallibility disappears; instead the frame loses epistemic sovereignty	Always provisional: later evidence, better operations, and affected persons must retain correction standing

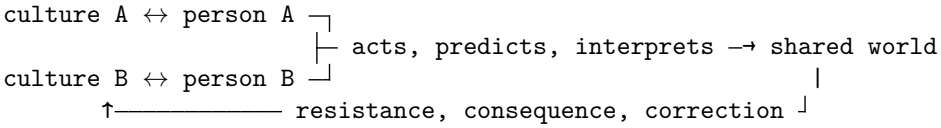

The *we* supplies language, examples, practices, methods, salience, trusted testimony, instruments, records, and standards of interpretation. It is not adequately represented as an average of individual opinions, because its inherited and distributed grammar can exceed what one present member could produce alone. *Epistemic Agency under Mechanical Solidarity* owns **collective epistemic formation** and the **distributed epistemic milieu** through which that grammar becomes locally executable.

The third question restores reality as an independent corrector of both answer and framework:

> **Objectivity is not absence of collective formation; it is a collectively sustained capacity to let the collective's own frame lose when the world answers against it.**

The world does not deliver uninterpreted propositions or abolish the need for concepts, values, and judgment. It can nevertheless produce resistance, surprise, failed prediction, material consequence, and repeatable difference that no social authorization creates. The constitutional issue is whether those encounters can change local reconstruction, public records, institutional operation, and the inherited grammar.

The relation is triangular and reciprocal rather than a linear passage from an isolated subject to an object:

The shared world is both a common object and a possible communication medium. People formed by different *we*s can jointly manipulate an object, imitate an operation, compare predictions, observe a failed intervention, and gradually form enough codebook overlap to identify where their words and models agree or diverge. They need not merge into one culture or possess identical concepts first. The water-play and electron examples in domain contact, conceptual formation, and symbolic addressing illustrate this operation-first bridge.

> **Shared reality is both the medium in which people can build compatible concepts through action and the independent source of correction when those concepts fail. Language can then name, compare, and extend what that contact makes available.**

Reality-mediated learning includes positive and negative contact. Repeatable success under relevant variation can disclose an affordance or a workable relation; resistance, surprise, and failed prediction can disclose a model's limit. Neither success nor collision explains itself. Both remain evidence whose scope, causal interpretation, protected conditions, and possibly delayed or displaced costs must be examined.

This realist claim remains mediated rather than naive. Michel Foucault's *regime of truth* question asks how procedures, institutions, classifications, sanctions, and authorized speakers allow a statement to function publicly as true. That inquiry can disclose why a world-fitting claim lacks public force or why an authorized claim has consequences despite poor fit. It does not by itself decide whether the claim corresponds to a reality independent of its authorization. Conversely, world-fit alone does not give a proposition public intelligibility, institutional uptake, or governing force.

The valid premise that every human encounter with reality is conceptually, linguistically, historically, and institutionally mediated does not entail that nothing can answer a mediation except its own authorization rules. People cannot occupy a cultureless standpoint outside every *we*, but the world does not require a *we*'s permission to act upon them or upon the objects they investigate. A socially formed water concept does not make water a product of that concept; the social organization of electron research does not authorize a thought collective to decide how

electrons behave. A classification can change how a person is treated and can thereby enter the causal history of later conduct without making every classified condition or material consequence a creation of discourse.

The relevant failure is therefore not social construction as such. It is **epistemic sovereignty of the mediation**: the stronger relation in which the inherited framework controls whether mind-independent resistance can be recognized, articulated, compared, and allowed to revise the framework itself. Critical Constructivism, deconstruction, Culture Mechanics, and every rival programme remain subject to the same specified-unit, source-position, consequence, appealability, and reality-correction tests. No school, author, method, or person receives the enclosure classification from the family resemblance alone.

The *we* can therefore mediate as bridge or barrier. Mediation is the general condition; barrier formation is a contingent but central failure in which a shared framework controls which encounters are noticed, which concepts and sources can be retrieved, which discrepancies may be articulated, and whether failed predictions can revise the governing account. The stronger failure does not make mind-independent reality disappear. It makes the world causally common while preventing it from remaining epistemically common around the protected relation.

Democratic correction and demos–jurisdiction–consequence congruence The me–we–world relation has a direct democratic application. **Feedback-boundary congruence** is the degree of fit among four relations for a specified decision:

1. **Demos / *we*:** the persons who recognize one another as continuing political co-authors;
2. **Jurisdiction:** the persons, institutions, and domains bound by the decision;
3. **Consequence community / world:** the persons and relationships that bear the decision's benefits, costs, risks, failures, and externalities; and
4. **Correction relation:** the routes through which affected experience, resistant consequences, investigation, comparison, appeal, and later judgment can alter the decision, its categories, and the authority that maintains it.

Demos–jurisdiction–consequence congruence is the democratic specialization of this wider feedback relation under one sufficiently interoperable political Culture Program. It does not require exact identity among one people, one territory, every person bound, and every consequence bearer. Congruence is graded, domain-specific, decision-specific, and often nested. Affected non-members may require standing, representation, protection, or correction access, while formal members can remain ineffective as authors or correctors.

The additional correction boundary matters because nominally overlapping populations do not close the learning loop when consequences are unrecorded, classified away, denied standing, or prevented from changing operation. Where burdens are displaced outside effective correction, worldly conditions change without producing a proportionate return path through sensing, representation, institutional operation, and common memory. The system can then appear stable or successful by excluding part of its own output from the state on which it learns.

The originating compact proposition is:

> **Democracy works best when the territorial scope of binding decisions maps sufficiently well onto a living political-cultural *we*.**

The general theoretical term is **jurisdiction** rather than territory. Territory often bounds a polity, its common institutions, and a materially shared consequence surface, but federalism, subsidiarity, functional autonomy, and soft secession can change who decides what without moving state borders. Congruence is therefore graded, domain-specific, and decision-specific rather than an assertion that one people, one state, and one border must coincide exactly for every purpose.

At the **me** relation, democracy preserves particular persons, minorities, parties, regions, and dissenters as legitimate sources of proposals, objections, testimony, and later correction. Political loss authorizes a bounded decision; it does not cancel the loser's personhood, opposition, evidence, or standing as a future co-author. Without that protected *me*, voting can merely certify the currently stronger collective power.

At the **we** relation, a living cultural demos supplies more than a formally shared voting rule. It supplies the operative meanings of fellow citizen, legitimate opposition, temporary authority, bounded defeat, evidence, appeal, correction, succession, and continued membership. The decisive counterfactual is:

> **After losing, does the participant remain a future co-author of the same political order?**

Where this relation survives, a person can experience the outcome as "a decision of our corrigible order with which I disagree." Where it fails, the same result can be experienced as "their Culture Program temporarily imposed upon us."

The relevant *Volk* in this functional sense is a historically formed cultural demos capable of carrying that relation, not merely the population listed in a legal register. Language, religion, ancestry, institutional similarity, or declared nationality may be traces, carriers, or products of its formation, but none establishes the operative *we* by itself.

At the **world** relation, an authorized proposal enters a shared material and social consequence surface. Schools teach, infrastructure works or fails, taxes alter conduct, institutions generate intended and unintended effects, policies distribute benefits and burdens, and predictions encounter resistant reality. Democracy becomes a culture-learning mechanism only where those effects can enter a common record, affected persons retain testimonial standing, and the resulting correction can revise both the decision and the shared programme that generated it. The complete circuit is:

```
plural persons and factions
            ME
             ↓
proposals, objections, testimony, dissent
             ↓
shared cultural demos and meta-order
             WE
             ↓
bounded decision inside a recognized jurisdiction
             ↓
implementation and common consequences
           WORLD
             ↓
success, failure, costs, exceptions, resistance
             ↓
preserved criticism, affected-person standing, and correction
             ↓
revised common memory, rules, and Culture Program
           WE′
```

This circuit applies ***Bewährung*** to democratic cultural development. Apparent success is not correction-tested robustness when voters can export costs beyond the adjudicative community, affected persons cannot enter the record, or the winning interpretation controls what failures are allowed to mean. The world can remain causally common while rival epistemic milieus prevent its consequences from becoming common correction.

Four mismatch patterns make the relation observable:

- persons bound without recognized co-authorship face domination pressure;
- persons materially affected but excluded from correction can become hidden cost bearers;
- political authors who can export decisive costs can obtain false *Bewährung*; and
- several mutually unintelligible *we*s forced to produce one compulsory answer can turn elections into contests for the common machinery.

The fourth pattern links this relation to cultural interoperability and Babelization. Procedures may continue counting votes and transferring office after policy experience has stopped revising one shared cultural order. One pathway into that mismatch is **cultural-epistemic fission** without corresponding jurisdictional differentiation: two or more separately reproducing political-cultural *we*s remain bound to one compulsory decision machinery. Fission does not itself establish Babelization or require separation; the stronger failure occurs only where translation, mutually legitimate adjudication, or required coordination falls below the anti-Babel floor at the specified interface. At the severe limit, incompatible required outputs, loss of mutually legitimate adjudication, and continuing unitary jurisdiction create the conditional secession-or-force fork.

The required congruence need not be a thick first-order culture at every scale. A lifted political *we* can bind person-standing, legitimate opposition, evidence, jurisdiction, bounded defeat, appeal, succession, and correction while leaving religions, professions, regions, and local communities substantial first-order freedom. Jurisdiction should then track the thickness and span of the culture that can actually carry it: thick local commonality can govern local first-order matters; a thinner but real lifted national order can govern the common shell; and wider consequences require an appropriately wider adjudicative level. Democratic cultural alloying owns the further distinction among procedural selection, integrative learning, and revision that produces a successor cultural form.

The historical source bridge is bounded. Václav Klaus's address on the future of Central Europe joins democracy to the nation-state, an identifiable people, bounded political space, and sufficient historically formed common

culture. Culture Mechanics generalizes that political intuition into jurisdictional and correction terms; it does not attribute the complete congruence mechanism to Klaus. Hermann Heller's 1928 "Political Democracy and Social Homogeneity" supplies a closer social-psychological predecessor: a felt *we* can contain serious opposition and make fair political contest possible, while material and cultural exclusion can leave democratic form operating as domination. Heller did not supply the complete me–we–world circuit, its consequence-side *Bewährung* test, the three-level alloying distinction, or the anti-Babel and soft-secession architecture developed here.

Open epistemic atmosphere, epistemic fog, and epistemic enclosure The distributed epistemic milieu can occupy three distinct correction conditions:

Condition	Operative relation	Correction boundary
Open epistemic atmosphere	Usable concepts, examples, methods, rival sources, question paths, and shared operations permit participants to notice, articulate, compare, and investigate.	Anomalies can become questions; rival participants can replay relevant operations; failed predictions and adverse consequences can revise local codebooks, public operation, and the milieu.
Epistemic fog	Some objects, distinctions, sources, or relations are difficult to see, name, retrieve, join, or communicate.	Correction is impeded because the relevant relation remains obscure, scattered, overcompressed, unavailable, or difficult to address, but no protected conclusion need yet control what correction is allowed to mean.
Self-sealing epistemic enclosure	A protected construction governs which observations, questions, speakers, and interpretations can acquire standing.	Contradiction is ignored, prohibited, or assigned an answer-preserving interpretation, so correction cannot reliably revise public operation.

These are correction conditions of one distributed milieu, not mental modules, collective processors, or a required chronological sequence. One institution can maintain an open atmosphere in one domain, fog in another, and enclosure around a protected question elsewhere.

An open atmosphere does not guarantee correct conclusions. It names correction permeability: errors can become inspectable and operative revision remains possible. Epistemic fog does not establish falsehood, conspiracy, repression, or intentional obstruction. Finite attention, missing concepts, weak education, inaccessible records, incompatible vocabularies, specialization, institutional fragmentation, and inherited dead formulas can all reduce visibility.

Self-sealing enclosure requires the additional answer-protection relation. The governing construction determines in advance why relevant correction cannot count. Depending on the evidenced unit and depth, Voegelinian Second Reality, un-reason, un-reality, or institutional correction nullification may then become applicable under their separate gates. None follows from fog, disagreement, social mediation, constructivist method, or one false conclusion alone.

When two culturally differentiated populations meet, fog and enclosure describe conditions within and across their distributed epistemic milieus; they are not yet the intergroup outcome. Fog can raise the cost of translation because relevant concepts, records, examples, operations, or source relations are difficult to retrieve and replay. A self-sealing enclosure creates the stronger asymmetry in which one milieu's protected account preclassifies why another milieu's evidence, standards, or correction cannot count. Either condition can contribute to intergroup semantic decoupling and possible Babelization, but Babelization requires the additional scale and threshold finding that shared translation, legitimate procedure, or required coordination has fallen below the anti-Babel floor.

The compact contrast is:

> **The open atmosphere lets the world become a question; epistemic fog makes the question difficult to form or share; epistemic enclosure supplies the protected answer before the world is allowed to answer.**

The controlled epistemic-cloud and all-seeing-eye picture makes the milieu's impersonal formation and the separate agentified gaze of bigOther-as-Thou visible without postulating a collective brain.

The me–we–world relation supplies an epistemic diagnostic rather than a complete moral verdict. The separate generator-valence audit in *Mythology Construction*, "The lifted sublimation-generator pattern" asks whether resulting practices are life-supporting, person-preserving, capability-producing, reality-answerable, and corrigible. These standards are themselves culturally articulated, but their bearers, capabilities, consequences, and correction paths are not made arbitrary by that social articulation.

Compact me–we–world diagnostic Use the relation as four joined but separately owned operations:

1. **Remove the me:** exchange persons or positions and test whether private or factional advantage supplied the justification.
2. **Expose the we:** identify the inherited concepts, distinctions, methods, sources, exemplars, and evaluative pressures—including those that merely *feel impartial* because everyone competent in the milieu uses them.
3. **Let the world answer:** specify shared operations, observations, predictions, consequences, and appeal routes capable of revising the common frame rather than merely generating another answer inside it.
4. **Audit the direction:** separately ask whether the resulting order is life-supporting, person-preserving, capability-producing, reality-answerable, and corrigible under the generator-valence audit owned by *Mythology Construction*.

The first three operations test epistemic position and correction. The fourth does not infer moral value from successful correction, persistence, or agreement; it restores the independently governed normative question of what and whom the corrected capacities serve.

The open reality–person circuit The me–we–world relation remains incomplete unless correction can return both to the world and to a concrete person encountered as a **You**. World-correction tests whether the shared representation survives resistant objects, events, and consequences. Person-correction tests whether the representation still permits an affected person's experience, claim, refusal, and non-fungible standing to interrupt what the collective is doing.

The full functional circuit is:

```
EDA encounter with bodies, events, and consequences
→ DCL naming, comparison, counterfactual reconstruction, and planning
→ We-mode sharing, authorization, and coordinated action
→ institutional enactment in the world
→ World interruption through resistant consequences
→ renewed EDA encounter and/or DCL--I reconstruction
→ You interruption by an affected person
→ revision of classification, permission, operation, or jurisdiction
```

This is a functional order of answerability, not a claim about compulsory clock time, separate brain modules, or a new processor. The I-mode–We-mode relation and the three-axis operative-agency model remain distinct from the stages of the circuit. Either interruption can arrive first, and each can expose what the other misses: material consequences may defeat a benevolent personal impression, while one person's testimony may reveal a harm hidden by aggregate success.

The pathological alternative is **DCL–We closure**:

```
DCL classification
→ We-mode authorization
→ institutional operation
→ produced resistance, suffering, anomaly, or failure
→ the same classification interprets the consequence
→ consequence confirms the programme
→ intensified authorization
```

Three failures can combine inside this loop:

1. **insulation:** persons, events, and consequences do not reach the deciding representation;
2. **filtration:** they are noticed but can appear only in the programme's own categories;
3. **moral inversion:** objection, suffering, or resistance is recoded as proof that stronger coercion is necessary or benevolent.

The programme can therefore know many accurate attributes of the affected person and still fail to meet that person as a You. The defect is not necessarily missing information, low intelligence, absent reflection, or literal inability to understand the words. It is the loss of an operative route by which a concrete person's claim can change classification, permission, conduct, or jurisdiction.

This supplies a bounded Culture Mechanics interpretation of the **desk-perpetrator** and one route into what is often discussed under the banality of evil: cognition, planning, language, and reflective judgment may remain intact while DCL serves a captured We-mode and institutional role. The proposition is not offered as a complete exegesis of Hannah Arendt, an exhaustive historical explanation, or a claim that every bureaucratic wrong has this mechanism.

World-detachability is DCL's capacity to operate through representations when their objects are absent. It is indispensable for memory, imagination, science, planning, moral universalization, and concern for people who are not presently encountered. Its danger begins when a representation loses its return obligation.

The same world-detachable capacity can close around a private self-story. **DCL–Me closure** occurs when imagined rehearsal, rumination, fantasy, or self-justification protects an I-position from encounter and consequence; **DCL–We closure** protects a collectively authorized representation. Daydreaming illustrates disengagement from present EDA, but it is not by itself un-reason or un-reality. The technical threshold is reached only when protected representation acquires operative authority while relevant correction can no longer change it.

A private closed representation may chiefly burden its author. Once a DCL–We representation gains institutional execution, it can export the costs of its errors to subordinates, outsiders, victims, or future persons while its carriers retain the confirming account. This asymmetry neither makes private fantasy harmless nor proves the collective account false; it explains why authorization, jurisdiction, and cost routing are part of the closure audit.

> **Thought must be permitted to leave immediate actuality, while actuality retains the capacity to call it back.**

Ordinary guilt can reopen the circuit by returning the actor to the affected person and the consequences of the act. Captured guilt instead asks whether the actor betrayed the programme, failed the role, or insufficiently enforced its classifications. The difference is not the intensity of bad feeling but the authority to which the feeling makes the actor answerable.

The open-circuit rule is therefore:

> **No We may monopolize the interpretation of either the world that resists it or the persons on whom it acts.**

Closure should be tested through several independent return routes:

- added information;
- direct encounter;
- imaginative or causal reconstruction;
- reciprocal application of the stated standard;
- independent consequences and observers; and
- the affected person's experience, claim, or refusal.

A genuine change through any route is evidence against total closure. Failure at one route does not establish failure at all the others, and refusal to accept the analyst's preferred conclusion is not itself a failed correction test. The relevant question is whether a route can change the operative judgment, permission, or jurisdiction under an answerable losing condition.

The complete diagnostic can be compressed in two forms:

> **The We enables transcendence of me. The I–You relation prevents that transcendence from sacrificing the person. The World prevents both from substituting their wishes for reality.**
>
> **Can the World defeat the account, can the You interrupt the permission, and can the I remain answerable for the act?**

The Perception–Context–Permission sequence locates the upstream authorization mechanism, while intergroup semantic decoupling and possible Babelization locates one way in which the personal return path becomes unusable. A practical audit asks what observation can change the description, whose testimony can alter permission, which outcome can contract jurisdiction, and whether a harmed outsider can still become You.

Anti-gnostic adaptive constitutional learning The originating stochastic-gradient-descent proposal supplies a candidate institutional form for reality's reserved right of correction. Its purpose is anti-gnostic:

> **No one is authorized because they possess X-ray vision. Persons and institutions may propose hypotheses only inside a correction loop whose evidence, evaluation, and revision they do not control alone.**

The generic architecture is:

```
PERSON-PROTECTING CONSTRAINT SHELL
rights · due process · jurisdiction · appeal · anti-abuse rules
                          ↓
DUMB PUBLIC KERNEL
few legible meta-rules · precommitted procedures · no insider exceptions
                          ↓
SMART PLURAL PROPOSAL LAYER
citizens · experts · professions · institutions · affected persons
                          ↓
ROBUST PLURAL SENSORS
predictions · observations · testimony · distributions · adverse outcomes
                          ↓
SEPARATED CORRECTION
audit · challenge · rollback · rule revision · succession
```

"Dumb" means small, public, legible, symmetrical, and resistant to opportunistic reinterpretation. It does not mean unintelligent, context-free, or incapable of being wrong. Complex expertise belongs in competing models, predictions, measurements, and criticism rather than becoming an interpreter's title to rule.

The functions of sensing, proposing, deciding, implementing, aggregating, auditing, and adjudicating should remain institutionally distinguishable. Formal separation is insufficient when nominally independent bodies receive the same formation, evidence package, appointment network, or incentive and therefore reproduce common-mode error.

The **stochastic gradient descent** comparison licenses bounded intervention, feedback, small updates where possible, rollback, and continued learning rather than worship of a current rule. It does not establish that society has one stable differentiable loss function, independent policy parameters, an observable gradient, or reversible consequences. Composite scorecards can make several outcome dimensions inspectable, but their selection, weighting, measurement, and aggregation remain political and gameable. The score must not become a numerical general will or collective subject.

Constitutional constraints therefore precede optimization:

```
first: determine the permissible region
then: compare and learn among permissible alternatives
```

Person-level standing, due process, and specified rights are not ordinary score components that a sufficiently large aggregate gain may silently purchase. Several sensors with different failure modes should challenge one another rather than being compressed prematurely into one oracle.

This controller is a skeleton, not a complete living constitutional order. Carriers must learn to report honestly, preserve adverse records, accept legitimate defeat, protect independent sensors, refrain from changing the metric after failure, and treat correction as fidelity rather than betrayal. The general epistemic architecture belongs here; its proposed implementation through bounded experimental jurisdictions, reversed legal priority, scorecards, and *Abstimmung mit den Füßen* belongs to *Culture Program Ecology*. Its proposed **Lifted-Order Capacity Dashboard** uses *Speak, Own, Refuse, Exit, Appeal, Correct, Cooperate, Build,* and *Choose* as separable candidate sensors. The dashboard is one application of the generic controller, not part of the definition of epistemic constitution and not a literal scalar loss function.

Model-mediated mandates and prediction exposure The integrated doctrine-generation and authorization pathway locates this model-mediated branch inside a larger mechanism joining causal story, mythology, master-signifier activation, PCP, authorization payload, and institutional implementation. This document does not own that complete construction sequence. It owns the generic constitutional requirement that no interpretation or implementer control alone the evidence and correction by which its mandate can lose.

When a scientific or administrative model participates in a binding decision, the correction loop must cover the complete **model-to-mandate custody chain**: observation, metric, model, conditional forecast, causal-harm translation, protected-principal valuation, severity threshold, alternatives, authorization, implementation, and outcome review. Empirical competence at an early stage does not grant X-ray vision at a later normative or jurisdictional stage.

The constitutional requirement is **prediction exposure**: authority to impose burdens on the strength of a model must remain answerable to a recoverable record of the model version, assumptions, scale, forecast range, counterfactual, predicted intervention effect, uncertainty, declared defeaters, review date, actual outcome, and resulting correction. The detailed prediction-ledger proposal and Dutch nitrogen worked audit belong to *Mythology Construction*. Here their generic function is to preserve reality's right to lower confidence, narrow permitted use, require compensation, reverse a measure, replace a custodian, or retire a model.

One failed prediction is not an automatic falsifier, and uncertainty does not prohibit precaution. But neither intervention, changed conditions, complexity, nor noisy evidence may become an unlimited post hoc explanation controlled by the same authority whose mandate is under review. The stronger the requested sacrifice and the weaker the corrective exposure, the stronger the requirements for independent validation, rival models, affected-person standing, appeal, reversibility, repair, and predeclared stopping conditions.

The elementary distinction is between a **model** and a **measurement**. A model calculates what should happen under stated data and assumptions. A measurement records what actually happened. The claim-resolution and localized-uncertainty rule prevents this distinction from becoming a blanket rejection of model-mediated evidence: inspectable models can support ranges, bounds, and conditional conclusions without becoming direct observations or exact reconstructions.

Suppose a model predicts rain for Tuesday. When Tuesday arrives, measuring the rainfall tests whether the prediction came true. Running another model that also calculates rain produces another prediction; it does not show that rain actually fell. This is especially important when both models use the same or similar assumptions:

```
earlier model predicts outcome X
→ later model also calculates outcome X
→ model agreement is presented as proof that X actually happened
```

A later model can legitimately strengthen or weaken confidence in the earlier prediction, especially when it uses independent data and methods. But until the predicted outcome is observed, the later result remains an updated estimate, revised forecast, alternative scenario, or agreement between models. It is not empirical confirmation that the original prediction came true.

The audit therefore asks:

- Which population or case did the original prediction concern?
- What outcome did it predict, and by what time?
- What can now be observed directly?
- If a causal route was part of the prediction, was that route observed?
- Is the claimed confirmation a measurement of the predicted outcome or another model calculation?

> **Models make predictions. Reality tests them. A later prediction must not be presented as the observed fulfilment of an earlier one.**

When public wording gives a later model output the evidential status of observed fulfilment, **LT-045 — Model-to-reality laundering** names the communicative operation. The label does not by itself establish that the model is false, that the substitution was deliberate, or that operative un-reality exists; those claims require their separate evidential gates.

The Sowell bridge adds a governing-person question to this model audit: **who decides, which dispersed knowledge reaches the decision, who bears the error, and who can make being wrong change the mandate?** When the same surrogate can select the model or rule, impose the decision, interpret its consequences, and retain jurisdiction after failure, correction itself has entered custody.

This **surrogate-correction asymmetry** is a constitutional condition, not a person-level accusation. It can occur without bad faith or a silent principal, and it is not established by appointment, expertise, delegation, judicial review, administration, or insulation from immediate public opinion alone. Elections and markets are also fallible sensors rather than truth or justice oracles. The discriminating comparison concerns access to situated knowledge, prospective constraint, distribution of error costs, independent audit, affected-person standing, appeal, removal, succession, and demonstrated revision after failure.

Bounded mechanisms and jurisdictional contraction A mechanism can perform a valuable function under specified conditions without deserving universal jurisdiction. Alexander Rüstow's critique of economic theology supplies the precursor: a conditionally useful market mechanism can receive credit for effects co-produced by law, trust, restraint, education, competition, and anti-capture rules until its boundary conditions disappear and non-intervention becomes a creed. The constitutional detector is general and symmetrical:

```
bounded mechanism performs under specified conditions
→ foreground mechanism receives disproportionate causal credit
→ enabling conditions and inherited reserves disappear from view
→ positively charged name becomes a master signifier
→ programme acting in that name claims unconditional jurisdiction
→ failure cannot reduce scope and instead authorizes expansion
```

The analysis must keep three objects separate:

1. the real mechanism and the conditions under which it performs;
2. the signifier that condenses its reputation and wider projected goods; and
3. the institutional programme, custodians, powers, and consequences installed in its name.

The core correction test is **jurisdictional contraction under failure**: which evidence can narrow the mechanism's authorized domain, change its preconditions, replace its custodian, or retire the intervention? If every success confirms the programme and every failure proves obstruction or insufficient application, the mechanism no longer faces an operative domain boundary.

The associated audit compares performance competition with obstruction competition, asks whether lived capability and responsible self-direction improve rather than only a preferred aggregate indicator, and subjects the proposed protector to the same capture and correction tests. A monopoly, captured rule, or domination layer can outlive the justification that first authorized it. None of this makes markets, diversity, state protection, expertise, or another bounded mechanism ideological by definition. The warning concerns precondition blindness plus non-contracting jurisdiction, not usefulness, popularity, abstraction, or moral language alone.

Power guardrails and the bounded protector The person-protecting constraint shell also constrains the institutions that claim to protect it. Elections, divided powers, due process, independent appeal, public contest, succession, property, refusal, and exit are corrigible implementations of a more general requirement: no public or private concentration of power should control both the person and the routes by which that power can be challenged, corrected, escaped, or replaced.

This requirement does not collapse state coercion, majority pressure, corporate or creditor leverage, platform control, professional gatekeeping, and cultural authority into one mechanism. Nor does it treat power as inherently pathological. It requires each power relation to be tested for jurisdiction, answerability, review, correction, succession, alternatives, and practicable exit. A public protector created to constrain private power remains subject to the same constitutional logic; otherwise protection can become a new self-certifying centre.

Distribution of jurisdiction can add a second safeguard. A single authority that controls policy, appointments, evidence routes, measurement, interpretation, and correction becomes a high-value capture target with a potentially order-wide blast radius. Genuinely independent bounded jurisdictions can act as separate failure domains, preserving comparison, alternatives, records, and recovery after a local failure. This is a relative capture-resistance hypothesis, not a general theorem for decentralization: common finance, software, formation, metrics, appointments, or appellate interpretation can recreate one effective control plane.

The full normative proposal, its Mausfeld-derived ***Schutzbalken gegen die Macht*** image, public/private power taxonomy, bounded-protector recursion, and diagnostic dashboard belong to *Culture Program Ecology*, "Democracy as *Schutzbalken gegen die Macht*". Its Mises-derived soft-secession application and capture-resistant Landkreis topology belong to "Soft secession and reversed legal priority". Here the narrower point is epistemic: no power may monopolize the evidence, interpretation, adjudication, and succession mechanisms by which its own authority is tested.

This rule applies to **meaning infrastructure** as well as visible state power. Education, classification, credentialing, publishing, public mediation, pastoral interpretation, and access to legitimate self-description can become a concentrated authority surface even when legislatures, executives, and courts remain formally separated. The answer is not one official counter-priesthood. Plural sources, independent institutions, affected-person standing, source access, visible interpretive disagreement, portable credentials, appeal, and institutionalized permanent

reflection can supply counterpower without pretending that meaning is politically neutral or that every interpretation is equivalent. Concentration is a hazard to audit, not proof that one carrier ecology acts as a coordinated sovereign.

9. Piety toward the real

The central virtue of the positive pole is **piety toward the real**. The phrase comes from sociologist **Robert N. Bellah's** introduction to *Émile Durkheim on Morality and Society*, where Bellah characterizes Durkheim as possessing a strong "piety toward the real." It is Bellah's phrase about Durkheim, not a standard Durkheimian technical term.

The present synthesis extends it into an epistemic-constitutional virtue:

- reality is not exhausted by present concepts;
- a satisfying narrative is not sufficient evidence;
- social facts may contain structures and functions invisible to first impressions;
- preferred theories must risk predictive and explanatory failure;
- consequences and surprises can defeat authorization;
- one's own side deserves especially careful checking;
- correction is fidelity to truth rather than betrayal of identity.

Piety toward the real must be joined to Durkheim's defense of the morally sacred person in "L'individualisme et les intellectuels". The combined formula is a synthesis rather than a quotation from Durkheim:

> **Respect persons unconditionally; evaluate propositions conditionally by evidence; regulate actions through justice.**

This prevents truth-seeking from becoming a license for contempt, denunciation, or coercion. Persons do not lose dignity when they are mistaken; propositions do not become true because their proponents possess dignity.

The corresponding Humanity boundary is developed in *Mythology Construction*. Every concrete person bears complete standing while realizing only a partial selection from the horizon of possible human development. An epistemic constitution violates this rule when it agentifies Humanity, grants privileged interpreters access to its alleged true interest, and treats present persons as material for that abstraction.

An expressive formulation of the same orientation is:

> **Shine the light of objective truth into subjective darkness—without appointing anyone sovereign owner of the light.**

This formulation can be read alongside Slavoj Žižek's *How to Read Lacan*, where he contrasts the Enlightenment image of rational illumination with the German-Idealist discovery of constitutive darkness within the subject:

> (Which is why, in German Idealism, the metaphor for the core of subjectivity is Night, the 'Night of the World', in contrast to the Enlightenment notion of the Light of Reason fighting the darkness around.)

Read together, the project-specific proper meaning is:

> **Bring the representations, propositions, classifications, and actions emerging from subjective Night into contact with evidence, other observers, consequences, and mind-independent reality.**

This final formulation is a Culture Mechanics synthesis, not Žižek's wording. Subjective Night does not mean mere ignorance to be eradicated: it names the opaque and potentially generative inwardness from which negation, imagination, and symbolic articulation can emerge. The light names fallible, plural, and corrigible contact with objective truth rather than a rational subject's or institution's sovereign possession of it.

9A. Cross-cutting semantic and epistemic architecture

This section is the authoritative home for the project's restricted theoretical *un-* family, its constitutive-relation-inversion and pseudomorphic-governor-substitution morphologies, and the typed relation among communicative operation, selection orientation, inferential mechanism, operative epistemic state, installed stock, and constitutional meta-order. The family is more general than the truth orientation: *un-reason* and *un-reality* directly apply constitutive-relation inversion, while pseudomorphic governor substitution is a thicker bearer-level morphology that may coexist with either but requires its own evidence. The *Linguistic Tricks* inventory owns the detailed communicative operations and **instrumental untruthfulness** as a selection orientation; this document owns their cross-scale relation and the complete positive interface joining reasonable critical discussion to independent reality-answerability.

The theoretical *un-* family **theoretical *un-* operation** *noun phrase* **Status:** proposed semantic and diagnostic family

The project uses *un-* in a deliberately restricted sense. It does not mean simple absence or opposition: a theoretical *un-X* names a deformation in which X's constitutive relation is negated, exceeded, reversed, or redirected from within. Every theoretical *un-* operation is deformative, but the prefix alone does not specify the deformation's complete morphology. The project presently develops two non-exclusive morphologies:

Morphology	Primary deformation target	Minimum bearer
Constitutive-relation inversion	The direction of the relation that makes an operation or status X	An inferential, interpretive, representational, or other operation in which X's characteristic activity remains active
Pseudomorphic governor substitution	A durable social bearer of X whose machinery and authority are governed by an incompatible principle	An established role, practice, procedure, office, profession, organization, or institution occupying a recognizable X-position

The morphologies can nest and coexist rather than forming mutually exclusive boxes. A durable institution can embody constitutive-relation inversion, and a pseudomorphic bearer can recruit un-reason or preserve un-reality, but none of those conjunctions follows from one component alone.

Constitutive-relation inversion **constitutive-relation inversion** *noun phrase* **Plain-language gloss:** reversed answerability **Status:** proposed direct relational morphology

> **Constitutive-relation inversion occurs when X's characteristic operations remain active, but the direction of answerability that makes them X is reversed: an output, commitment, or authorized representation governs the inputs or correctors to which it should answer.**

This is a relation-level *un-* operation. It does not require a bounded institution, a stable public office, inherited organizational machinery, a distinct beneficiary, or control of succession. It must nevertheless be instantiated in a specified argument, interpretive practice, representation, domain, or period; an abstract doctrine or disliked idea is not classified merely by resemblance.

The two canonical epistemic applications are:

Application	What remains active	Constitutive direction	Inverted direction
Un-reason	Inference, explanation, evidence use, distinctions, and criticism	Evidence and independent correction evaluate the conclusion; the conclusion can lose	A protected conclusion evaluates what evidence and correction may mean; the conclusion must survive
Un-reality	A representation's socially authorized reality-function	Independent events, consequences, and correction can revise the representation's authority and practical use	The authorized representation controls how events, consequences, and correction may count while retaining practical authority

Un-reason is an inferential or correction-defeating **mechanism**. Un-reality is a socially operative epistemic **state** that can be preserved by un-reason but can also arise through coercion, omission, ritual assent, fear, memory control, synchronized incentives, or correction nullification. Mind-independent reality is not inverted; the deformed object is the representation's relation of answerability to it.

The relation-level detector asks:

1. What is the specified X-operation or status, unit, domain, and period?
2. Which direction of answerability is constitutive of X?
3. Which characteristic operation or standing of X remains active?

4. In a collision, does the candidate output answer to its proper corrector, or does it control how that corrector is interpreted or allowed to count?
5. What observable result would make the output lose authority, change, or cease to qualify, and does that result have its declared effect?

Institutional control-surface, beneficiary, portability, and succession audits must not be imported merely because this relational gate is satisfied. They become relevant only after a durable candidate bearer has separately been specified. Conversely, a culturally distributed mythology or Culture Program can carry and reproduce un-reason or un-reality without one bounded institution satisfying the pseudomorphic-governor-substitution gate.

Pseudomorphic governor substitution **pseudomorphic governor substitution** *noun phrase* **Plain-language gloss:** retained-form governor substitution **Status:** proposed process and diagnostic morphology

> **Pseudomorphic governor substitution occurs when a durable social bearer retains X's recognizable form, machinery, and authority while an incompatible principle becomes its operative governor over consequential choice, correction, and reproduction or succession.**

The author's controlling image is:

> **Something slips into the skin of X.** The recognizable form, machinery, and authorized position of X remain, but a different inner principle governs their operation.

The bearer can be an established role, practice, procedure, office, profession, organization, or institution. A human actor can instantiate the morphology only through a specified role and period; the classification attaches to that role-operation rather than becoming a whole-person essence. The process is **pseudomorphic governor substitution**. The resulting bearer is a **functional pseudomorph of X**. The notation *un-X* records the internal deformation without making the prefix itself the name of the process.

Culture Program Ecology calls one typed application-result a **pseudomorphic chief**: a person or directing office retains the recognizable form and bottom-up authority of collective representation while another principal or governing objective controls consequential direction, correction, and reproduction or succession. This does not create a second pseudomorphic process. It is established only when the complete bearer, retained-form, substituted-governor, collision, correction, and succession gate defined here is met.

The full bearer-level definition is:

> **Under pseudomorphic governor substitution, a durable social bearer continues to occupy the appearance, machinery, and authorized position of X while a different inner principle takes control and redirects that machinery toward a function incompatible with ordinary X.**

Its compact form is:

> **A functional pseudomorph of X is X-shaped operation governed from within by an incompatible non-X principle.**

The typed construction is:

```
durable X-bearing practice, role, or institution
+ retained X-form
+ retained claim to X-authority
+ displaced inner governing principle
+ contrary or distorted operative result
= un-X
```

The operative governor is the selection rule that repeatedly decides what is rewarded, protected, sacrificed, corrected, and reproduced when purposes conflict. It may be an explicit command, but it may also emerge through incentives, metrics, dependencies, status, institutional selection, or synchronized expectations. The construct therefore does not require one designer, conscious deceit, or private recognition of the substitution.

Six components should be kept distinct:

Component	Diagnostic question
Bearer	Which continuing role, practice, procedure, office, profession, organization, or institution occupies X's social position across more than one isolated act?
Form	Which names, roles, rituals, procedures, and professional vocabulary remain recognizable as X?
Machinery	Which offices, methods, records, metrics, resources, and decision processes still belong to X?
Authority	Which legitimacy, trust, prestige, access, or jurisdiction continues to be claimed in X's name?
Governor	Which principle repeatedly controls consequential choices and sacrifices?
Correction and reproduction	Which principle decides what can count as failure, change operation, reproduce standards and dependencies, and select future interpreters or officeholders?

The threshold is exposed in **collision cases**:

> **When X's constitutive purpose conflicts with another principle, which one repeatedly wins, and can X's correction machinery reverse that result?**

Routine outputs can remain genuinely competent and X-like because they preserve legitimacy, maintain useful machinery, and conceal the hierarchy among governors. Conflict, failure, refusal, adverse evidence, resource scarcity, correction, transfer, and succession are more discriminating because X and the candidate substitute governor predict different conduct there.

Condition	Operative relation
Error within X	X's purpose still governs; failure is recognized and correction can restore performance.
Degraded X	Performance is poor, but X's success criterion and correction relation remain intact.
Misuse of X	X's machinery is temporarily used for another purpose, but the system can identify and reverse the misuse.
Objective drift	A competing principle increasingly influences metrics, appointments, and decisions.
Capture	The competing principle gains durable control over machinery, correction, and succession.
Functional pseudomorph of X	X's retained form and authority now legitimize machinery governed by the incompatible principle.

Correction capture marks the strongest transition. In ordinary failure, X's standard can trigger investigation, revision, removal, repair, or learning. Under mature substitution, X-shaped correction machinery reclassifies failure or the corrector so that criticism cannot restore X and instead protects the substitute governor.

The morphology is related to but narrower than several neighbours:

Neighbour	Boundary
Hypocrisy	Professing X while knowingly or strategically failing to practise it concerns inconsistency between claim and conduct; it need not capture X's real machinery, correction, or succession.
Counterfeit X	A counterfeit may merely imitate X's appearance; a functional pseudomorph normally occupies or inherits real X machinery and authority.

Neighbour	Boundary
Corruption	Corruption is a broader family of degradation or improper influence; pseudomorphic governor substitution specifies retained form plus an incompatible operative governor.
Objective substitution	Authority granted for objective A is used to institutionalize objective B. This is a central mechanism that can produce pseudomorphic governor substitution, but it does not by itself establish retained form, correction capture, or recursive succession.
Projective consensus	An underdeterminate positive signifier lets heterogeneous participants project compatible goods before a custodian supplies executable meaning. It can widen authorization for objective substitution, but it does not establish that a real X-bearing institution has acquired an incompatible governor.
Capture	Another principle gains durable control of machinery, correction, and succession. Capture names a control-acquisition process; it can produce pseudomorphic governor substitution and the resulting functional pseudomorph, but the concepts are not identical.
Pretext	X may never have governed at all; an X-shaped wrapper can be pseudomorphic from inception rather than produced by later displacement.
Decoupling	Formal structure and activity can diverge without one incompatible principle yet governing correction and succession.
Constitutive-relation inversion	An argument, interpretation, or authorized representation can reverse its relation of answerability without a durable X-bearing institution or control of organizational reproduction. Pseudomorphic governor substitution adds that thicker bearer-level requirement.
Not-X	X's form and authority are absent rather than occupied and redirected.

This formulation separates a social bearer's machinery from the constitutive purpose that should govern it. It is more precise than describing *un-X* only as X's immanent self-negation: that phrase names the resulting inversion but does not identify what persists, what has been displaced, what replaces it, or how operation changes.

The morphologies are independent enough to require separate gates:

Configuration	Possible instance	Evidential boundary
Un-reason without PGS	One argument or recurring interpretive regime makes a protected conclusion govern every defeater	Does not establish capture of the institution in which the reasoning occurs
Un-reality without one bounded PGS bearer	A distributed authorized representation governs conduct across a mythology, Culture Program, professional field, media ecology, or network despite failed correction	Does not identify one substituted institution, beneficiary, or succession system
PGS without un-reason or un-reality	A captured regulator accurately understands the relevant facts yet directs real regulatory machinery toward an improper beneficiary	Does not require self-sealing reasoning or a correction-insulated representation of reality

Configuration	Possible instance	Evidential boundary
Conjunction	A durable X-bearing institution serves an incompatible governor, protects that operation through un-reason, and preserves an un-real public account of its function	Requires the bearer-level, mechanism-level, and state-level gates separately

Where the morphologies coexist, their evidence can connect but must not be counted as though one classification proved the others.

Worked analogies and boundaries The theoretical *un-* family has close functional neighbours without making them identical. The analogies below expose either direct relation inversion, retained-skin bearer substitution, or looser semantic kinship; they do not claim that each ordinary-language term satisfies either complete technical gate.

Dead / not dead / undead

```
DEAD
a corpse without animation

NOT DEAD
an ordinarily living being

UNDEAD
the form and condition of the corpse remain,
but something continues to animate it
```

The undead is not simply alive again. Animation has entered the “skin” of death without restoring ordinary life.

Mensch* / *Nicht-Mensch* / *Unmensch

```
MENSCH
a human whose capacities remain joined to recognizable humanity

NICHT-MENSCH
an animal, machine, god, or another being outside the human category

UNMENSCH
a human being whose human appearance and capacities remain,
but whose operative relation to other persons has been occupied
by cruelty, instrumentalization, or monstrosity
```

The *Unmensch* is disturbing precisely because it is not an alien merely pretending to be human. The monstrosity operates through genuinely human intelligence, language, organization, and agency. Ordinary German *Unmensch* is a pejorative noun for a cruel or inhumane person; Žižek’s specialized *inhuman* names an excess inherent to humanity. Neither ordinary usage alone establishes the project’s complete pseudomorphic-governor-substitution morphology.

Reason / not-reason / un-reason

```
REASON
evidence tests the conclusion;
the conclusion can lose

NOT-REASON
no inferential process is operating:
a sensation, scream, silence, impulse, or unsupported assertion

UN-REASON
arguments, evidence, distinctions, and explanations remain,
```

```
but conclusion-protection governs their use;
the conclusion cannot lose
```

A simple hypothetical shows the functional reversal:

```
Prediction: The world will end on Tuesday.
Tuesday passes normally.

Reason:
The prediction failed; revise or abandon the theory.

Un-reason:
Our faith prevented the catastrophe,
so the apparent failure confirms the theory.
```

The auxiliary explanation reverses reason's correction relation by making the protected conclusion govern the meaning of the failed prediction. Not every auxiliary hypothesis is un-reason: the classification requires a larger pattern in which no reciprocal evidence, failed prediction, or consequence is permitted to defeat the protected account.

Democracy / non-democracy / sham or "un-democracy"

Un-democracy is not standard English, but the contrast makes the subtype visible:

```
DEMOCRACY
elections and institutions permit rulers to lose power

NON-DEMOCRACY
an openly declared monarchy or dictatorship

SHAM OR "UN-DEMOCRACY"
elections, parties, courts, parliament, and democratic language remain,
but the system is arranged so that the ruling power cannot lose
```

Established descriptions such as *sham democracy* or *electoral authoritarianism* should normally be preferred in empirical classification. The analogy shows domination occupying democratic machinery while continuing to claim democratic authority; one irregularity or adverse election result is insufficient.

Familiarity / cronyism / obligation-governed selection

The presence of a relationship does not decide whether an institutional use of that relationship is legitimate. The discriminating issue is what the relationship is permitted to govern:

Pattern	Governing use of the relationship
Legitimate relational trust	Prior work supplies relevant and corrigible evidence about role performance, reliability, judgment, temperament, or team coordination; demonstrated performance remains able to defeat the judgment.
Bounded familiarity preference	Lower uncertainty or coordination cost receives a limited and proportionate premium, while prospective role criteria, accountability, comparison, and correction remain operative.
Cronyism	Loyalty, comfort, membership, or personal protection becomes a private claim upon institutional authority and overrides the office's proper purpose or selection criteria.
Patronage	Appointments or resources maintain a durable supporter network through benefits exchanged for loyalty, service, or political support and thereby reproduce the patron's position.

Pattern	Governing use of the relationship
Favour-bank episode	A prior benefit produces a remembered or communicated obligation that is later withdrawn through a request, responsive institutional act, routed beneficiary, and consequence.
Favour-bank cloud	Portable obligations are recurrently routed through brokers, third parties, hierarchical control surfaces, refusal costs, and recursive placement across people or institutions.

These are not mandatory stages on one ladder. Cronyism requires no prior benefit or debt, while a favour-bank route can place a genuinely competent person. In the latter case the candidate defect lies in the governor and obligation the institutional act serves, not in incompetence by itself. Patronage and a favour bank can overlap, but downward benefits exchanged for support do not by themselves establish the prior-benefit and portable-obligation route.

Six tests make the boundary operational:

Test	Discriminating question
Relevance	What role-relevant delivery, judgment, reliability, or cooperation did the prior relationship actually establish?
Proper principal	Is personal knowledge being used to serve the office, organization, client, or public, or is the office being used to serve the relationship, patron, benefactor, broker, or routed third party?
Stranger counterfactual	Would a comparably qualified person without the relationship receive the same standard, opportunity, protection, review, recovery path, and succession power, allowing only a premium proportionate to genuinely additional information?
Correction	Which performance or conduct evidence could remove the person, protection, or future appointment power, and does such evidence have operative effect?
Refusal	Can the person reject an unrelated later request, including a request benefiting a third party, without losing access, standing, protection, or future opportunity?
Reproduction	Does the relation stop with one decision, or do selected and protected people acquire power to repeat the same selection, protection, and succession pattern?

The compact boundary is:

> **Reputation is legitimate when it carries corrigible information about performance; it becomes cronyism when relationship standing overrides the office's purpose; and it becomes favour-bank currency when a prior benefit creates a portable obligation that institutional power is later used to repay.**

An extended-order office can make a person answerable through an impersonal third position–law, profession, standard, office, or conscience–even when no concrete beneficiary is present to demand performance. Keep the immediate evaluator or rule carrier, the concrete protected beneficiary, and the ultimate principal distinct. Cronyism and favour-bank repayment can then be understood as one possible moral-scale transposition: a small-group grammar of personal loyalty occupies a jurisdiction whose proper operation depends upon impersonal reciprocal rules. This cross-link does not establish a favour-bank debt or a pseudomorphic governor substitution without their separate evidential gates.

None of these relations alone establishes a functional pseudomorph of a meritocratic selection system. The stronger classification requires that the retained selection machinery and its merit authority are now durably governed

by relationship preservation, obligation repayment, or network reproduction, especially across correction and succession.

Science / non-science / pseudoscience

English uses *pseudo-* rather than *un-* here, but the construction is a close functional neighbour:

```
SCIENCE
method and evidence can defeat the theory

NON-SCIENCE
poetry, ritual, music, or another practice making no scientific claim

PSEUDOSCIENCE
experiments, graphs, citations, technical vocabulary, and experts remain,
but the protected theory controls what every result is allowed to mean
```

Pseudoscience is not merely an absence of science. At the relation level, a protected theory can control what every result means without establishing that an institution has been captured. At the bearer level, an established practice or institution can additionally occupy science's machinery and authority while the protected theory controls correction and reproduction. Error, immaturity, or later refutation does not by itself establish either classification.

Freud's *heimlich* / *unheimlich*

Freud's *The Uncanny* begins with the semantics of *heimlich* and *unheimlich*. The uncanny is not merely wholly external or unfamiliar: something formerly familiar, often concealed or repressed, returns in an estranged form. The familiar has become internally alien. A scholarly overview supplies a modern interpretive bridge.

This is not an exact instance of pseudomorphic governor substitution: *unheimlich* does not necessarily retain the authorized institutional position of *heimlich*. It is a semantic precursor to the image:

> **The recognizable form remains, but something alien has appeared within it.**

For the pseudomorphic bearer-level morphology, the compact boundary is:

> **Not-X stands outside X. Un-X occupies X's form and authority-position while redirecting its machinery according to a principle that ordinary X would reject.**

Or, in the author's image:

> **Un-X is something operating inside the skin of X and speaking with X's authority, although its inner rule and effective function have changed.**

This is not a universal rule for words beginning with *un-*. English and German use the prefix for absence, opposition, deprivation, reversal, and other relations. *Unknown*, for example, ordinarily means only "not known." A proposed classification as pseudomorphic governor substitution must satisfy the stronger retained-form and displaced-governor test.

Two diagnostic programmes and their safeguard The theoretical *un-* family creates a third category between X and the absence of X. Its constitutive-relation-inversion morphology identifies a direct reversal in what answers to what:

```
X-operation remains active
-> X's proper output remains answerable to an independent corrector
-> the direction reverses
-> the output controls how the corrector may count
```

Its pseudomorphic-governor-substitution morphology identifies a thicker, bearer-level use of X's authority, admits sincere and distributed production, and makes gradual capture visible:

```
retain X's vocabulary, ceremonies, and institutions
-> claim X's legitimacy
-> redirect X's machinery
-> produce an outcome X should have prevented
```

The bearer-level morphology therefore directs diagnosis toward the gap between advertised and operative institutional function. The relation-level morphology instead directs diagnosis toward reversed answerability even where no bounded X-bearing institution exists. Un-reason uses reason's operations and standing; un-reality retains an

authorized representation's reality-function; a pseudomorphic science practice or sham democracy additionally occupies a durable social position and its machinery.

```
occasional exception
-> protected exception
-> asymmetric standard
-> recursive explanation
-> correction becomes threatening
-> conclusion controls evidence
-> mature un-reason
```

It also shifts diagnosis from inaccessible intent toward observable operation: Can the conclusion lose? Are standards reciprocal? Does evidence change practice? Who controls the defeat conditions? Does criticism become confirmation? Does an institution preserve the appearance of correction while nullifying its effects? Intent remains important, but it is investigated as a separate layer.

Constitutive-relation inversion acts as one **compressed research programme**. It asks:

- what operation or status remains recognizably X;
- what should answer to what;
- whether an output now controls the inputs or correctors to which it should answer;
- how that reversal becomes observable; and
- what would make the output lose, change, or cease to qualify.

Pseudomorphic governor substitution acts as a second, thicker research programme. It asks:

- which durable social bearer occupies X's position;
- what remains recognizably X;
- what normally governs X;
- what has replaced that governing principle;
- how X's authority is retained;
- how its operation has been inverted; and
- why participants may sincerely continue calling it X.

The same family can be applied, with a morphology and defeat conditions declared each time, to reason, socially authorized reality, science, law, democracy, care, education, therapy, and other practices. Do not force an argument or distributed representation into an institutional skin test, and do not infer bearer-level capture from a relation-level inversion.

> **Pseudomorphic governor substitution moves the theory from identifying bad content or deceptive actors to analysing captured forms–systems whose visible machinery remains intact while their governing function has been replaced.**

This strengthens symmetry: every programme, including the analyst's preferred one, remains subject to the relevant test. It also suggests different functional remedies. If the problem is un-reason, additional arguments can supply additional defensive material; correction requires restoring reciprocal standards, independent reality contact, and a genuine possibility of losing. If the problem is un-reality, public contradiction is insufficient unless it can change records, classifications, resources, jurisdiction, and conduct. If the problem is a functional pseudomorph, correction must additionally reach the bearer's control surfaces, dependencies, appointments, transfer, and reproduction or succession.

The theoretical *un-* family must not become a magic prefix for disfavoured phenomena. Its **shared family gate** requires every proposed *un-X* diagnosis first to specify:

1. the unit, domain, period, and X-operation or status;
2. X's constitutive relation or governing function;
3. what characteristic operation, standing, form, machinery, or authority remains;
4. which relation has been inverted or which principle has taken control;
5. how un-X differs observably from both X and not-X; and
6. what evidence would defeat the classification.

A pseudomorphic-governor-substitution diagnosis must additionally specify the durable social bearer, retained X-machinery and authority, candidate substitute governor, discriminating collision cases, and control of correction and reproduction or succession.

If an *un-X* diagnosis cannot lose, it risks becoming an instance of what it purports to diagnose.

Trace-poor governor-dependent practices and the bearer-level detector Pseudomorphic governor substitution is easiest to verify where X leaves persistent traces outside the bearer's control. The most vulnerable practices are **trace-poor and governor-dependent**: whether they remain genuine depends principally on which rule governs discretion, sacrifice, correction, and succession, while the institution itself controls much of the evidence used to classify its operation.

Practice class	Primary anchor	Relative natural resistance to substitution
Substrate-anchored	Persistent properties and performance of an external object or process	Higher: concealment is possible, but material traces survive.
Rule-anchored	Compliance with determinate and inspectable rules	Intermediate: the rule can be verified, but it may itself be gamed or displaced.
Governor-dependent	The principle actually controlling discretion, sacrifice, correction, and succession	Lower unless the exercise of entrusted power deliberately produces discriminating traces.

The highest vulnerability combines low natural trace density, high discretion, semantic elasticity, tacit governing relations, distributed causality, long latency, multicausality, endogenous evidence, evaluator dependence, correction custody, succession control, weak counterfactuals, privacy constraints, and low reversibility. The dangerous limit is a **self-certifying practice** in which the institution performs X, defines successful X, selects the evidence, accredits its evaluators, judges criticism, and controls appeal and succession.

Trace-poor does not mean traceless. The social trace families are:

Trace family	Observable question
Commitment	Which purpose, principal, criteria, defeat conditions, procedures, and stopping conditions were specified before the particular case appeared?
Decision	Who exercised authority, which information and conflicts were available, and which contemporaneous reasons and rejected alternatives were recorded?
Comparator	How were otherwise similar insiders and outsiders, aligned and unaligned candidates, or equal-stakes mirror cases treated?
Distributional	Across many decisions, what best predicts selection, protection, funding, correction, advancement, and burden?
Consequence	Who receives the benefit, who bears failure or sacrifice, and whose authority, resources, or position survives?
Refusal	What happens after a person declines an unrelated request, dissents, reports failure, appeals, or exits?
Correction	Can adverse evidence change records, decisions, personnel, resources, prestige, jurisdiction, criteria, and repair?
Succession	Which people, standards, dependencies, training routes, data systems, evaluators, and appeal authorities are reproduced?

Before comparing governors, specify X's protected principal, operative purpose, required capabilities, prohibited substitutions, success and failure conditions, correction mechanism, and stopping condition. Plausible substitute governors can include organizational survival, personal loyalty, revenue, prestige, ideological conformity, liability avoidance, power expansion, convenience, protection of prior decisions, or network reproduction. The bearer-level

detector therefore compares a declared governor with one or more candidate substitute governors in cases where their predictions diverge:

```
specify X's constitutive function and defeat conditions
→ name plausible substitute governors
→ select collision cases and record what each governor predicts must be sacrificed
→ compare matched insiders, outsiders, alignments, and equal-stakes mirrors
→ test whether adverse correction changes operation
→ audit which governor controls succession
```

Typed machinery routing and function-local application The general bearer-level detector establishes the pseudomorphic-governor-substitution morphology; it is not a universal substitute for the detector appropriate to the retained machinery. After identifying that machinery, route the inquiry through the specialized mechanism or institutional audit that can generate discriminating traces, then return those findings to the unchanged PGS collision, correction, and reproduction or succession gate:

```
identify retained X-machinery
→ select the detector specific to that machinery
→ construct claim-matched collision and boundary tests
→ trace whether correction changes consequential operation
→ return the results to the bearer-level PGS gate
```

The routing is conditional rather than cumulative. Do not apply every specialized detector to every bearer, and do not let a failure inside one companion audit establish PGS without the durable-bearer and substituted-governor relations. Examples include:

Retained machinery	Conditional companion route	Discriminating relation exposed
Reporting, intake, monitoring, detection, classification, case aggregation, or public trend claims	Report-to-reality laundering and endogenous observation; add the moralized reporting and report-to-mandate audit where reporter recruitment, operator custody, amplification, mandate, or resource feedback is present	Whether reports become verified cases, prevalence, priority, or remedy through tested bridges; whether observation growth and operator dependence govern the result
Certification, education, professional capability, entrusted service, or claims of institutional performance	Boundary-crossing reality challenges and auditability by design	Whether the claimed function survives an externally selected, domain-valid, consequential task outside the claimant's representational custody
Appointment, promotion, patronage, reciprocal access, or relationship-based selection	The familiarity–cronyism–obligation detector above; add the favour-bank audit only where a prior benefit, obligation, later withdrawal, routed act, and consequence are in question	Whether corrigible performance information or relationship preservation, obligation repayment, and network reproduction govern entrusted power

The report-production route is mandatory for a PGS application when a bearer:

1. solicits, receives, or automatically detects observations;
2. controls one or more consequential transformations from observation to category, record, case, count, rate, or trend; and
3. publishes or authorizes the result as knowledge about an external phenomenon.

Add the full institutional Meldestellen audit where the same chain recruits moralized citizen observation, concentrates intake and evidentiary custody, routes the output through public authority, or converts it into mandate, sanction, jurisdiction, or further observation. Add the resource-coupled audit whenever the output can affect the bearer's funding, staffing, prestige, renewal, jurisdiction, or organizational survival.

PGS should initially be bounded to the function for which the operative governor can be evidenced. One organization can simultaneously perform support, intake, classification, estimation, communication, and advocacy, and the

proper governor of one function does not automatically classify the others. Broaden the bearer only when the same candidate governor demonstrably controls consequential collisions, correction, and reproduction across those functions.

The same discipline applies to a multi-institutional pipeline. Audit its nodes and interfaces separately before treating the pipeline as one bearer. Repeated propagation alone shows distribution, not one governor, common intent, or a common PGS bearer. A pipeline can satisfy the bearer gate only where it operates durably as an X-bearing practice or procedure and the evidence shows that the candidate governor controls consequential selection, correction, and reproduction across its interfaces.

Within every routed audit, distinguish a **disclosed safeguard** from an **operative safeguard**. A caveat, review channel, audit rule, conflict declaration, appeal, or formal independence receives operative correction weight only to the extent that it can change the consequential claim, decision, record, resource, authority, personnel, or subsequent operation it is supposed to govern. For claims translated across technical, executive, press, media, political, and funding registers, compare whether scope, uncertainty, source dependence, and defeat conditions travel with the claim. A limitation retained in a technical register while a stronger implication recurrently governs mass communication or institutional action is evidence of a collision between formal answerability and operative output, not evidence that correction has already succeeded.

The specialized module supplies evidence about its own mechanism–for example, endogenous observation, inference laundering, custody concentration, metric gaming, capability mismatch, or obligation-governed selection. That evidence becomes PGS evidence only when it also shows that an incompatible principle repeatedly wins over X's constitutive function and controls whether correction changes operation and which standard is reproduced.

The bearer-level protective implication is:

> **Where the claimed X-function is difficult to inspect, force it to operate across a consequential boundary not controlled by the suspected substitute governor.**

Culture Program Ecology owns the concrete boundary-crossing challenges, auditability-by-design rules, mandatory institutional portability, and revocation-of-trust applications.

Intellectual precedents and the project's additional step The theoretical *un-* family combines but does not simply reproduce three semantic precedents:

- **Kant's infinite or indefinite judgment** distinguishes simple predicate denial from affirmation of a non-predicate and opens an indeterminate third domain. The *Stanford Encyclopedia of Philosophy* discussion of Kant's theory of judgment supplies the general distinction; Mark Siebel's review cautions that its exact logical gain and interpretation remain disputed.
- **Žižek's undead and inhuman contrasts** in *How to Read Lacan* provide the nearest direct semantic precedent: *not dead* differs from *undead*, and *not human* from *inhuman*. Indefinite negation reveals an excess or distortion immanent to the category, but does not yet supply the complete retained-machinery and substituted-governor mechanism.
- **Freud's *unheimlich*** supplies internal estrangement of the familiar rather than mere external unfamiliarity. It does not supply the full functional or institutional relation.

Culture Mechanics adds two operational steps. Constitutive-relation inversion identifies X's proper direction of answerability, the characteristic operation or status that remains, its observable reversal, and a possible defeat condition. Pseudomorphic governor substitution additionally identifies a durable social bearer, retained form, machinery, and authority, a substituted governor, collision cases, and control of correction and reproduction or succession. Neither project morphology should be attributed to Kant, Freud, Žižek, or Hegel.

The word *pseudomorphic* is a controlled mineralogical analogy. A pseudomorph retains the outward crystal form of another mineral although its material composition has been replaced or altered. The analogy supplies retained outer form under changed composition; it does not make institutions minerals, prove hidden replacement, or supply the governor, correction, and succession relations by itself.

Organizational and institutional research supplies complementary parts of the morphology:

Predecessor or neighbouring tradition	What it discovered	Contribution to the project synthesis
Robert Merton: goal displacement	Rules and procedures introduced as means to an organizational purpose can become ends in themselves, so conformity to machinery obstructs achievement of the purpose.	Explains how the operative governor can change while the organizational machinery survives.
Philip Selznick: institutionalization, co-optation, and mission	Informal commitments, constituencies, and power relations can redirect formal purposes; leadership must defend mission and critical values rather than merely administer efficiently.	Explains how accumulated relationships can become an organization's effective constitution and reproduce its redirection.
Robert Michels: oligarchical tendencies of organization	Leadership specialization, information and rule control, indispensability, long tenure, mutual nomination, and practical barriers to recall can consolidate the power of elected leaders over electors while democratic forms persist.	Explains how control of expertise, opposition, appointment, and succession can make formally representative machinery reproduce an oligarchical governor.
Meyer and Rowan: formal structure as myth and ceremony	Organizations can retain approved formal structures for legitimacy and resources while practical activity becomes decoupled from them and inspection gives way to confidence and good faith.	Explains the retained legitimate skin and why ordinary formal signals can cease to demonstrate actual function.
Nils Brunsson: organized hypocrisy	Organizational talk, formal decisions, and conduct can systematically diverge so that incompatible audiences are satisfied.	Explains how contradictory appearances and practices can persist instead of quickly collapsing.
Lawrence Lessig: institutional or dependence corruption	An institution can be corrupted without bribery or individually corrupt members when routine and lawful relations make it dependent on something other than the dependence proper to its purpose.	Supplies the closest abstract relative: displacement of the proper governing dependence.
Regulatory-capture theory: George Stigler	A regulator can retain public office, legal authority, and public-interest language while organized interests acquire regulation for their own benefit.	Supplies a concrete political form in which the same control surface remains but its beneficiary changes.
Andrews, Pritchett, and Woolcock: isomorphic mimicry	Governments can adopt the outward structures and policies of capable institutions without their functionality, gaining legitimacy and resources while remaining in a capability trap.	Supplies the closest account of a preserved shell in which *looks like* substitutes for *does*.
Donald Campbell: indicator corruption	When a social indicator governs consequential decisions, adaptation pressures corrupt the indicator and distort the activity it was intended to monitor.	Explains a clear governor substitution in which the representation of the goal becomes the operative goal.
Richard Feynman: cargo-cult science	A practice can reproduce science's visible forms while lacking the disclosure, rival testing, replicability, and correction relations that constitute scientific integrity.	Supplies a nearly literal case of un-science: the form is present while the constitutive inner relation is absent.

No one neighbour supplies the complete project morphology. The project synthesis joins retained form and authority, displaced governor, redirected benefit or objective, correction capture, and recursive succession. Merton and Campbell clarify governor change; Lessig and capture theory clarify changed dependence or beneficiary; Meyer and Rowan, Brunsson, and isomorphic mimicry clarify persistence of the credible shell; Michels and Selznick clarify institutionalization, leadership consolidation, and reproduction; Feynman clarifies how the constitutive correction relation can be absent despite recognizable practice forms. Michels's *iron law* is retained here as a neighbouring hazard account rather than adopted as inevitability: organization, leadership, tenure, or expertise alone establishes neither an incompatible governor nor a functional pseudomorph.

Several neighbours also propose corrective disciplines that converge with parts of the project detector:

Source	Source-proposed corrective discipline	Relation to the project
Donald Campbell	Competitive and independent replication, data access for critical reanalysis, competing internal and external evaluations, and invited minority reports that do not become organizational disloyalty.	Supplies source-grounded precedents for independent comparison, raw-record access, plural evaluation, and protected internal correction.
Richard Feynman	Disclose details that could invalidate the preferred interpretation, investigate rival causes, publish results regardless of direction, and permit actual replication.	Supplies an epistemic integrity discipline for adverse evidence, rival explanation, result-independent reporting, and reality contact.
Andrews, Pritchett, and Woolcock	Begin with locally nominated performance problems, authorize experimentation and positive deviance, use tight feedback loops, and engage broad sets of agents.	Supplies a function-first alternative to importing impressive forms and a practical route from local failure through iteration toward demonstrated capability.
Lawrence Lessig	Identify the dependence proper to the institution, then ask whether a different dependence has displaced it.	Supplies the dependence audit: whose continuing support, money, approval, information, or protection does operation actually require?

These proposals remain distinct from the project-developed synthesis. Culture Mechanics joins them to retained form and authority, explicit candidate governors, collision and sacrifice cases, correction capture, succession, trace-generating institutional design, and response thresholds.

Voegelin: untrue existence, Second Reality, and question-space governance Eric Voegelin's **truth of existence**, **untruth or untrue existence**, **Second Reality**, and ***metaxy*** belong near un-reason and un-reality but are not synonyms for them. In "On Debate and Existence" and his wider experience-and-symbol inquiry, Voegelin describes human existence as finite participation in reality: between knowledge and ignorance, order and disorder, time and transcendence. Truth of existence is the willingness to remain answerable to this condition; untrue existence is a revolt against the *condicio humana* in which a constructed account overlays experienced reality and protects itself against the questions that could reopen it.

The distinction is not between a perfect model and an imperfect one. Every human model is incomplete. The stronger failure occurs when the model acquires authority over what evidence, experience, contradiction, and questioning are permitted to mean:

```
first reality:
experience + finitude + uncertainty + contradiction + consequence

second reality:
a closed construction determines what those encounters are allowed to signify
```

Mind-independent reality is not abolished. Material, biological, interpersonal, and institutional consequences continue. The construction instead intercepts their interpretation, so recalcitrant events can be redescribed as

confirmation, impurity, sabotage, backwardness, insufficient effort, or proof that the authorized transformation must intensify.

Culture Mechanics adopts Voegelin's established vocabulary for this existential and interpretive layer while preserving its own typed constructs:

- **untrue existence** concerns the person's, movement's, institution's, or culture's operative relation to finite reality and questioning;
- **Second Reality** names the protected interpretive construction;
- **un-reason** names reason-shaped conclusion protection;
- **un-reality** requires an authorized representation with socially operative reality-status that survives failed correction; and
- **Babelization** concerns loss of the common translation and adjudication surface required for one shared order.

The terms may be used at person or collective scale only when the construction, domain, excluded questions, recurrence, and correction-neutralization route are specified. They are not permanent human essences, clinical diagnoses, or licences to infer untruth across every domain of a person's life.

Question-space governance and appealability A closed order can govern more than accepted answers. It can govern whether an experience becomes an admissible question at all. **Question-space governance** separates at least five operations:

1. **answer suppression:** the question is intelligible but a proposed answer is forbidden or punished;
2. **question prohibition:** asking the originating question is itself treated as disloyal, impure, dangerous, or unintelligible;
3. **semantic foreclosure:** available vocabulary already classifies every formulation inside the authorized answer;
4. **attentional foreclosure:** the relevant analogy, cause, bearer, consequence, or contradiction reliably fails to become salient; and
5. **institutional non-reception:** a question can be spoken but no authorized record, hearing, investigation, adjudication, or correction route can receive it.

Internalized pre-articulation suppression can combine these operations: the question fails to form before an external censor needs to act. This relation joins the person-side negative-space fingerprint to the constitutional reception path without treating silence as proof of inner capture.

Appealability asks whether a proposition, classification, office, or programme admits a forum not already controlled by the challenged authority: reciprocal reason, independent evidence, affected-person answer, institutional appeal, succession, or reality-mediated consequence. An answer need not remain permanently open in every proceeding, but the order must preserve the originating question, grounds, limits, and conditions of reopening.

Voegelin supplies the source relation among engendering experience, questioning, answering symbolism, opacity, Second Reality, and prohibition of questions. In "On Debate and Existence", he describes an answering construct that can be "erected into an idol valid for all time." The following three-state operational register is a Culture Mechanics synthesis around that relation, not a list of three technical terms taken verbatim from Voegelin:

- a **living symbol** reconnects recipients to the engendering experience and keeps the originating question available;
- a **dead formula** persists after that experience has been forgotten; and
- an **idolized answer-symbol** acquires authority to prohibit the experiences and questions that could reopen it.

The adjacent signifier vocabularies have narrower contributions. Lacan's **master signifier** helps describe a privileged signifier around which other meanings and identifications organize; Laclau's **empty signifier** helps describe a comparatively underdeterminate token representing a larger heterogeneous whole or absent fullness. Neither source supplies the project term **idolized answer-symbol**, its projection-surface-with-a-lock image, or the transition from symbolic compression to prohibited reconstruction. Not every master signifier or empty signifier is idolized, and semantic openness, heterogeneous projection, or affective charge alone does not establish the lock.

An idolized answer-symbol can be pictured as an affectively charged projection surface with a **lock**. Recipients may load the symbol with positive or negative hopes, fears, loyalties, or hostilities, while its authority prevents them from opening it to inspect what it operationally means, which question it answers, what consequences belong to it, and what evidence could correct it. Projection, affective charge, ambiguity, or compression alone does not establish idolization. The defining addition is the lock against reconstruction and correction: attempted reopening is treated as disloyal, immoral, ignorant, pathological, or institutionally inadmissible. The lock is explanatory shorthand, not a

separate mental processor or evidence of secret intent; it can be implemented through question disqualification, exclusive interpreter custody, correction sanctions, or institutional non-reception. A detailed doctrine can therefore be idolized, while an emotionally powerful or semantically open symbol is not idolized if its meaning, generating question, consequences, and defeat conditions remain inspectable.

As a compact illustration rather than a categorical classification, consider the possible use of **communism**:

> **A defeated answer is not a defeated question.**

Questions concerning exploitation, concentrated power, insecurity, ownership, and social obligation endure even when a communist answer has failed. The token *communism* functions as an idolized answer-symbol when it retains authority as the projected solution while past experiments and their causal record are prevented from counting against it–for example, when every failure is classified in advance as not real communism, sabotage, betrayal, or insufficient implementation. It is not idolized merely because someone uses the word, reconsiders one of those questions, distinguishes cases, or proposes a corrigible alternative. Symmetrically, *communism failed* becomes a dead formula when its reasons and historical evidence can no longer be reconstructed, and it becomes an idolized closure if it is used to prohibit the enduring questions rather than to preserve the evidence relevant to answering them.

A second bounded illustration is the pre-1980s PRC official name for the Great Leap Forward famine period, **"Three Years of Natural Disasters."** Karl Gustafsson's study of Chinese famine memory documents that official usage and its later replacement by "Three-Year Period of Difficulties." The earlier formula is relevant to the present construct where assigning the event to natural disaster gave one causal answer operative authority while displacing questions about procurement, reporting, mobility restrictions, agricultural policy, institutional incentives, and blocked correction. The wording alone does not establish an idolized answer-symbol: the classification requires evidence that the formula actually governed responsibility, inquiry, and the reception of contrary causal evidence rather than serving as one incomplete but corrigible description.

Operation-bootstrapped codebook formation supplies a communication-level bridge without redefining Voegelin's existential terms. A living symbol remains capable of cueing local reconstruction of enough of its engendering experience, distinctions, and question to guide application and correction. A dead formula retains the token after that practical reconstruction path has been lost or detached. An idolized answer-symbol goes further: the surviving token and its authority prohibit the operation-rich inquiry that could rebuild, test, or revise its meaning. The relation is neither literal memory replay nor proof that every recipient reconstructs one identical experience. At the generic learning level, **living knowledge** names the resulting reconstructible and corrigible capability; the present section classifies the symbol's relation to its engendering experience and question.

Voegelin's distinction between **compact** and more **differentiated** symbolization adds a comparison rule. Different symbolic vocabularies can articulate related structures of experienced existence at different degrees of differentiation without being literally identical or historically descended from one another. Comparison should therefore test the experienced tension, question, orientation, and correction relation carried by the symbols rather than equating words, institutions, or doctrines by surface resemblance. Functional equivalence is a hypothesis to demonstrate, not a licence to erase historical difference or declare every later formulation a clearer version of an earlier one.

These are interpretive states, not a new three-step historical law. A stable formula can transmit hard-won knowledge efficiently, and not every recipient must repeat the founding experience from the beginning. The failure occurs when symbolic custody defeats appeal and reality correction.

Participation-to-mastery inversion and reality-matrix divergence **Participation-to-mastery inversion** is the proposed route by which finite participation in society, history, science, or humanity is redescribed as possession of its total logic and therefore as jurisdiction to transform its other participants. Expertise, political judgment, and ambitious reform do not satisfy the type. The stronger conjunction requires a totalizing claim, authorized interpreters, expanded jurisdiction, and loss of an external correction condition.

When two parties retain grammar and formal inference but no longer admit a sufficiently common experienced reality capable of deciding between their constructions, the conflict reaches **reality-matrix divergence**. Lexical disagreement concerns words; inferential disagreement concerns accepted moves; correction-regime disagreement concerns evidence and defeaters; adjudicative disagreement concerns who may decide. Reality-matrix divergence lies beneath them: the parties no longer occupy the same operative relation to the reality to which those procedures were supposed to answer. This can contribute to Babelization, but one closed argument or metaphysical difference does not by itself put a society below the anti-Babel floor.

The account must be reflexive. A Culture Mechanics analyst reproduces the X-ray closure when they claim privileged sight of another person's "real programme," treat disagreement as confirmation, prohibit questions about the framework, and state no observation that could revise the classification. Critical Constructivism therefore remains subject to the same question-space, appealability, source-position, consequence, and reality-correction tests it applies elsewhere.

Un-reason: reasoning that defeats the conditions of reason **un-reason** *noun* **Status:** proposed cross-scale mechanism and project term

Un-reason is an internal epistemic failure mode in which inferential, conceptual, interpretive, or critical capacities remain active—sometimes with great sophistication—but conclusion-protection takes control of their operation. Arguments, evidence, distinctions, citations, and criticism retain the recognizable machinery and authority-claim of reason while a conclusion, authority, identity, or programme is protected from reciprocal standards and independent correction.

> **Un-reason is reason-shaped operation governed by the requirement that a protected conclusion survive irrespective of what independent correction should do to it.**

Its epistemic result can still be described as self-negating: greater skill at explanation, distinction, criticism, and defence helps disable the account's capacity to lose. That is the result of the displaced governing principle, not the complete definition. Constitutive-relation inversion owns the direct reversal by which a protected conclusion governs the evidence and correction to which it should answer. A durable institution can embody that reversal, but un-reason alone does not establish pseudomorphic governor substitution. **Un-reason is not Žižek's term, not Hegel's term, and not a claim that either thinker proposed this mechanism.** Nor is subjective Night itself un-reason. Night names the opaque, negative, and generative inward ground from which many forms of articulation can emerge; un-reason names one possible organization of articulated thought after it has entered justificatory and social circulation.

A characteristic programme-level sequence is:

```
intellectual and critical capacity
→ identity-, authority-, or programme-protected conclusion
→ selective concepts, premises, evidence, burdens, and exceptions
→ counterevidence redescribed through the protected account
→ criticism becomes confirmation, impurity, or proof of hidden power
→ sophistication increases while independent correction closes
```

Relation to sublimation and the failing-reactor picture The controlled **nuclear-reactor, sublimation, and un-reason analogy** connects un-reason to the project's cultural-sublimation architecture while keeping three failure forms separate:

- loss of regulation, cooling, or containment maps most directly to **de-binding, desublimation, or disorganized discharge**;
- a reactor operating effectively while powering a destructive project maps to **destructive sublimation**—discipline and capability remain, but their destination is destructive;
- a safety system that moves thresholds, discredits inconvenient sensors, redescribes alarms as confirmation, and controls its own shutdown conditions maps to **un-reason**.

Un-reason is therefore neither the reactor's fuel nor the meltdown. It is analogous to active epistemic safety logic being repurposed to protect continued operation from the warnings that should correct or stop it. In this sense, un-reason can be an **epistemic misdirection of sublimated intellectual and critical capacity**: disciplined reasoning has been successfully formed, but its operation now insulates a protected account. Sublimation and un-reason remain different constructs, and neither Hegelian Night nor the Lacanian Real is a stock of psychic nuclear energy.

This distinguishes **anti-reason** from **un-reason**. *Anti-reason* is a broad directional description: a doctrine or practice may explicitly reject rational constraint, prohibit inquiry, or oppose institutions of public reason. *Un-reason* identifies the more specific internal mechanism by which the operations of reasoning themselves undermine their truth-corrective conditions. An openly irrationalist order can be anti-reason without elaborate un-reason; a highly articulate programme can instantiate un-reason while praising reason, critique, science, or emancipation.

Un-reason can operate within a person, argument, discipline, Culture Program, or institutional correction system. Its neighbours must remain distinct:

- **motivated reasoning** describes directional cognition and can be one person-level contributor; un-reason additionally names a recursively organized epistemic operation that can be distributed and institutional;
- **sophistry** is an argument-shaped communicative practice and may implement un-reason, but one fallacy or sophism does not establish the wider mechanism;
- **systemic lying** is a constitutional pole toward which un-reason can contribute, but coercion, omission, ritual assent, or memory control can produce systemic lying without it, and localized un-reason need not constitute an entire order;
- **doublethink** is a narrower contradiction-tolerance mechanism that can help implement un-reason or systemic lying, but accepting incompatible propositions does not by itself establish either one;
- **intelligence, complexity, and criticism** are not evidence of un-reason. The mechanism concerns what reasoning permits to count against its protected account, not how abstract, radical, technical, or politically unwelcome the account appears.

Doublethink as a narrower contradiction-tolerance mechanism George Orwell's *Nineteen Eighty-Four* supplies **doublethink** as a literary-political mechanism: incompatible propositions can both remain authorized, and the operative proposition can change with the Party's present requirement without the contradiction being permitted to correct the system. The mechanism is not identical with ordinary cognitive dissonance. Dissonance names tension produced by inconsistency and often a motivation to reduce it; doublethink names coexistence, compartmentalization, or authority-governed switching that prevents effective cross-comparison and correction. It can therefore help a participant remain sincerely identified with an account while also performing, administering, or defending claims that conflict with it.

Marija B. Petrović and Iris Žeželj deliberately borrow Orwell's word for a narrower empirical construct in "Exploring the Mechanisms that Allow Incompatible Beliefs to Coexist in the Cognitive System". Their **Proneness to Doublethink Scale** counts endorsement across eleven pairs of incompatible beliefs. In two preregistered Serbian studies (combined $N = 691$), doublethink was positively related to need for cognitive closure and several families of irrational belief, negatively related to actively open-minded thinking, and did not predict the examined non-evidence-based health practices. The authors propose that incompatible beliefs may enter a permeable belief system and then remain compartmentalized without cross-referencing. Their correlational studies operationalize individual differences; they do not establish Orwell's totalitarian training mechanism, political imposition, strategic lying, or the Culture Mechanics constructs.

The relations must therefore remain typed:

Relation	Boundary
Doublethink → possible un-reason component	Authorized contradiction may help protect an account, but un-reason additionally requires recursive organization against reciprocal standards and independent correction.
Un-reason without doublethink	Burden asymmetry, moving defeat conditions, selective evidence, or criticism-as-confirmation can close correction without any explicit pair of contradictory beliefs.
Doublethink without systemic lying	Compartmentalized inconsistency can remain individual, local, corrigible, and politically unorganized.
Doublethink within systemic lying	Contradictory authorized claims can be retained because loyalty, practical usefulness, or present authority outranks cross-comparison and correction.

The linguistic neighbour is not doublespeak. Orwellian **Newspeak** acts on the available symbolic vocabulary; doublethink acts on the relation among beliefs. The Newspeak-style vocabulary-restriction mechanism is kept in the linguistic inventory. Neither mechanism proves the other, and one observed contradiction does not diagnose either.

Diagnosis must specify the person, text, programme, institution, domain, and period under examination. Evidence includes persistent burden asymmetry, exceptions available only to the protected side, contradiction tolerated without a declared contextual rule, post-hoc changes to defeat conditions, criticism reclassified as confirmation, adverse consequences removed from evaluation, and the inability to name an observation that would reduce confidence. The hypothesis is weakened by reciprocal standards, explicit defeaters, successful correction, preserved

rival accounts, independent audit, acknowledged failure, and revision that changes practice. No conclusion about intelligence, motive, population, or political identity follows from the term alone.

Relation to cultural interoperability and Babelization **Un-reason and Babelization are not identical. Un-reason can be a mechanism that drives communication toward Babelization.**

The crucial distinction is:

> **The shared real world remains causally common, but ceases to be epistemically common.**

A person cannot literally negate mind-independent reality. Events and consequences still occur. What an un-reasoning operation negates is their authority as independent correction. In the limit case, every observation is translated through the protected account:

- supporting evidence confirms it;
- counterevidence reveals hidden power, bias, or misunderstanding;
- failed predictions are redescribed as evidence of complexity;
- criticism demonstrates the critic's implication in the system;
- different standards become legitimate whenever needed to protect the conclusion.

Reality still "speaks" through consequences, but no longer has an agreed language in which it can pronounce against the account.

Baader's "march through definitions" as an upstream semantic route

Roland Baader's *totgedacht* (2002), in the section "Marsch durch die Definitionen," pp. 127–128, supplies a verified source-attested compression of one possible semantic route into this problem. The intellectual-vocation link is explicit rather than merely thematic. Immediately beforehand, Baader's section "Verrat der Intellektuellen," pp. 124–126, treats Benda's *La trahison des clercs* as a classic, describes moralizing theses as making prevailing opinion "immun gegen Fakten," and describes intellectual prominence and apparent competence as amplifiers of political passions. Baader then moves from that Bendaian vocation-level betrayal to definition hollowing and occupation as a further method by which error can acquire attractive public form. Baader describes the "inhaltliche Aushöhlung von Begriffen" followed by their "Besetzung" through new or changed interpretation and writes:

> **„Noch ‚erfolgreicher' als der Marsch durch die Institutionen war der Marsch durch die Definitionen."**

In the surrounding passage he argues that transformed meanings of central political and public terms can make mutual understanding nearly impossible and invokes both Orwellian Newspeak and Babylonian linguistic confusion. He also explicitly says that tactical falsification cannot always be clearly separated from longer-running changes in the *Zeitgeist*. The source therefore supplies the aphorism, the semantic-hollowing and reinterpretation observation, the institutional comparison, and the understanding-breakdown warning without proving one centrally directed campaign.

Culture Mechanics places that source observation inside a typed cross-scale route:

```
familiar term retains public authority, evaluative force, and institutional routing
→ its definition, extension, or practical center changes
→ observations and consequences are interpreted through the revised term
→ possible un-reason if a protected conclusion controls whether correction counts
→ possible un-reality if an authorized classification governs consequential practice despite correction
→ possible semantic decoupling and Babelization if common translation and adjudication fail
```

The controlled *Emperor's New Clothes* analogy makes the first reversal visible. The swindlers define inability to see the cloth as evidence that the observer is foolish or unfit for office, so the empty loom discredits the observer instead of defeating the claim. That compact relation illustrates a self-sealing definition; it does not make unaided perception sovereign in complex empirical, legal, historical, or moral disputes.

Where a durable institution retains its recognizable machinery and authority while changed definitions redirect consequential operation, this semantic route can also contribute to pseudomorphic governor substitution. Neither definition change nor Baader's phrase alone establishes that thicker bearer-level morphology.

Definitions necessarily evolve, and conceptual engineering can repair a bad category, clarify a mechanism, or extend standing to genuinely analogous cases. The source bridge therefore does not turn unfamiliar usage, political disagreement, or one contested definition into evidence of manipulation. An application must specify the term,

unit, domain, period, earlier and later meanings, retained evaluative or institutional force, practical use, and effect of correction; deliberate coordination and political authorship require their own evidence.

Is that Babelization?

Only at a certain threshold:

Condition	What remains possible
Ordinary disagreement	Shared facts and procedures can adjudicate the dispute.
Localized un-reason	Words and facts remain shared, but the protected claim cannot lose. Communication continues, but joint inquiry is impaired.
Epistemic semantic decoupling	The parties no longer share what counts as evidence, contradiction, expertise, or correction. This is a descriptive bridge at a specified interpersonal or domain scale, not a new cultural-scale category.
Cultural interoperability breakdown (Babelization)	Translation, legitimate common procedures, and necessary coordination fail below the anti-Babel floor.

Thus, one self-sealing dispute is not yet cultural Babelization. But if un-reason spreads across central classifications—truth, evidence, justice, personhood, harm, and authority—and destroys trusted adjudication routes, it can contribute to **intergroup semantic decoupling** and eventually to cultural interoperability falling below the anti-Babel floor.

Babelization also does not mean literal inability to exchange sentences. People may understand the words, negotiate transactions, issue commands, or coordinate tactically. What becomes impossible is reliable translation and adjudication inside one shared epistemic order. The failure may remain specific to one domain, relationship, institution, or pair of cultural groups while other domains retain a larger **residual interoperability scale**.

At a severe Babelization interface where one binding output remains unavoidable, the relation reaches the **secession-or-force fork**: either reduce compulsory common jurisdiction or impose one answer without a mutually legitimate common judge. When power itself determines which claims, standards, rights, and exceptions are valid, the force branch becomes open domination. Under the project's strict definition, it becomes *Machtpolitik* only when a systemic-lying core, captured or exploited ideological power, culture-mechanical mobilization, a power-seeking objective, and Cipollan bandit–carrier payoff asymmetry are also evidenced. This further political fork does not follow from localized un-reason or failed persuasion alone. Once its conditions do hold, jurisdictional separation is the only branch that exits the loop without one programme overpowering the other. The pluralist application prefers soft separation where feasible because continued contact and a thin common shell can preserve a path toward restored interoperability and voluntary reunion.

How do you reason with someone operating through un-reason?

The phrase should remain a provisional, domain-specific description rather than a global identity assigned to the person. The first task is to test whether any **reality-correction interface** survives. More facts alone will usually not help if the mechanism already controls what facts are permitted to mean.

Useful questions are:

- "What observation would make you less confident?"
- "Would this same standard bind your side if our positions were reversed?"
- "Can we state the standard before examining this particular case?"
- "Who or what could serve as an independent observer?"
- "What different outcomes does your account predict?"
- "If the prediction fails, what specifically will be revised?"

This shifts the discussion from the disputed conclusion to the conditions under which conclusions may lose.

For the specialized **person-side, neutral-to-culture-loaded comparison**, see *Epistemic Agency*, "Latent Culture Program diagnosis under homo-duplex orthogonality". That proposed contrastive correction-interface probe samples whether a disclosed causal form remains corrigibly available across differently loaded cases. It is not identical to this generic interface test and does not turn one failed exchange into a latent-program, Ideology, radicalization, or person diagnosis.

If the person can name genuine defeaters and later update, the bridge remains. If every imaginable result confirms the account, then rational persuasion about that protected claim is temporarily impossible—not because communication has ceased, but because the conversation is no longer a joint truth-seeking procedure.

At that point, the proportionate response is usually to:

- stop feeding an endless recursive argument;
- state the closure clearly;
- preserve written claims, predictions, and standards;
- use independent observers or procedures where possible;
- restrict joint decisions to propositions that can be operationally verified;
- establish boundaries, appeal routes, or exit where agreement is unnecessary.

The deepest warning sign is therefore not "this person rejects my facts." It is:

> **No possible fact, consequence, observer, or reciprocal standard is still authorized to correct the protected account.**

That is the point at which localized un-reason approaches a Babelization boundary. It should still be diagnosed by domain and period, however—not turned into the claim that the entire person is permanently unreachable. Babelization requires the further scale and threshold evidence specified in its primary semantic home.

Un-reality: operative reality-status insulated from reality **un-reality** *noun* **un-real** *adjective* **Status:** proposed cross-scale epistemic state and project term

Un-reality is a socially operative epistemic condition in which an authorized representation continues to function publicly as reality—classifying what counts as fact, directing decisions, and allocating status, guilt, burdens, resources, permissions, sanctions, or jurisdiction—while independent observation, prediction, consequence, and dissent can no longer reliably reduce its authority or revise its practical use.

An **un-real representation** need not be believed privately by every participant and need not be false in every component. Its defining feature is the fitted relation among authorization, practical jurisdiction, participation pressure, and blocked correction. A claim that happens to be true can be held un-really when it has been made institutionally incapable of losing. A false claim can remain outside un-reality when it is openly testable and correction changes what the relevant people and institutions do.

The hyphen applies the project-specific **theoretical *un-* family** through constitutive-relation inversion at the operative-state level rather than un-reason's mechanism level. Reasoning itself remains active in un-reason; mind-independent reality is never transformed or negated by un-reality. What persists is the representation's **socially authorized reality-function**, while independent reality-correction has been displaced as its governor:

```
reality-anchored order
independent events and consequences
        → can correct the authorized representation
        → correction changes confidence, use, action, or rule

un-reality
authorized representation
        → controls how events and consequences may be interpreted
        → retains operative authority through failed correction
```

The project therefore does **not** create *not-reality* as one technical bucket. Nonexistent objects, fiction, declared simulations, mistaken reports, false propositions, and incomplete models have different logical and social statuses. None establishes un-reality without operative reality-status and a failed correction relation.

The relation to neighbouring constructs is typed:

Relation	Boundary
Un-reason → possible un-reality mechanism	Intelligence can supply distinctions, exceptions, revised burdens, and criticism-as-confirmation through which an authorized account survives contact with consequences. Un-reason is neither necessary nor sufficient: coercion, omission, ritual assent, memory control, synchronized incentives, or simple institutional inertia can also preserve un-reality.
Un-real representation → un-reality	One representation can govern one office, policy, discipline, or domain un-really without constituting an entire social meta-order. Specify representation, domain, institution, population interface, and period.
Organized un-reality	Multiple human, linguistic, symbolic, incentive, record, and institutional channels are fitted to reproduce un-real reality-status and defeat correction. Organization can be deliberate, emergent, or mixed; the term does not identify a designer.
Systemic-lying epistemic constitution → organized un-reality	The systemic-lying pole is the full constitutional meta-order that recurrently generates, selects, authorizes, protects, and replaces organized un-reality. Local or domain-specific un-reality does not establish that full ideal type.
Un-reality $\nrightarrow$ conscious universal deception	Some participants may knowingly lie, others may sincerely believe, doubt themselves, conform, compartmentalize, or follow role incentives. No inference to one conspiracy, motive, pathology, or population guilt follows.
Un-reality $\nrightarrow$ Babelization	A domain can be un-real while external observers, rival institutions, shared language, and common adjudication survive. Babelization requires the separate intergroup and anti-Babel threshold.

The originating expressive compression is retained because it makes the relation between compulsory public participation and recruited intelligence memorable:

> **A lie becomes un-real when everyone must inhabit it, and un-reason begins when intelligence is recruited to explain why the visible contradiction cannot count.**

Here **lie** uses the broad systemic-lying register rather than asserting that every sentence is false or every carrier knowingly deceives. **Everyone must inhabit it** means that persons within the relevant jurisdiction or participation surface must orient consequential public conduct as though the representation were authoritative; it does not require literal unanimity, private belief, or total social reach. **Visible contradiction** includes any independently inspectable evidence, failed prediction, adverse consequence, or rival account that should be capable of changing practice; it is not limited to naked-eye perception.

The corresponding strict formula is:

> **An authorized representation becomes un-real when relevant participants must orient consequential conduct as though it were reality while independent correction cannot change its authority or use. Un-reason operates when intelligence is recruited to explain why the counterevidence cannot count.**

Diagnosis therefore asks not merely whether a contradiction can be spoken, but whether disclosure can change confidence, classification, action, resource allocation, jurisdiction, remedy, personnel, or the governing rule. Public admission without operative revision can leave the procession running.

Representational attention sinks and ensemble selection A **representational attention sink** is a selected example, image, case bundle, or reporting ensemble that absorbs finite public attention and corrective effort in a direction poorly matched to the operative distribution of the represented harm. Every displayed instance may be possible or even authentic. The distortion can arise from **ensemble selection**: repeated countertypical examples, unreported baselines, asymmetric category resolution, or omission of the cases that would change priority and remedy.

```
individually possible or authentic instances
+ selection that obscures the relevant distribution or comparator
+ institutional use that directs vigilance, burden, or remedy
→ possible representational attention sink

+ correction cannot alter the ensemble's authority or practical use
→ possible un-real representation
```

The first line does not by itself establish un-reality. Selection can reflect sampling error, privacy constraints, pedagogy, editorial novelty, uncertainty, limited data, or an attempt to correct a previously neglected case. Diagnosis therefore requires the relevant denominator, time and jurisdiction, measurement quality, the purpose of the representation, its practical consequences, and what happens when a valid comparator is supplied. One poster, anecdote, rare counterexample, or omitted statistic establishes neither falsity, intent, systemic lying, nor a population essence.

Within anarcho-tyranny, an attention sink can support target substitution: the comparatively harmless or politically convenient proxy occupies the foreground while serious protection failure remains difficult to make commonly visible. This is a possible covering mechanism, not a required component of every anarcho-tyranny configuration.

The sparse Fernandes–HateAid–Hubig–ARD worked application uses the contrast between exceptional celebrity mobilization, an unmeasured specific deepfake gap, and recurrent embodied-harm comparators as an attention- sink probe. The mobilization disparity is evidence about salience and routing, not by itself proof of state nonprotection.

Contrast-amplified residual salience and "Spencer's Law" **contrast-amplified residual salience** *noun phrase*

Status: conditional candidate mechanism extracted from a Davies–Spencer–Baader source line

In "Spencer's Law: Another Reason Not to Worry" (2001), Stephen Davies coined **Spencer's Law** for a relation he attributed to Herbert Spencer: public concern about a social problem can increase as its actual incidence declines. Roland Baader's *totgedacht*, pp. 177–180, adopts Davies's name and highlights historical ignorance, increased contrast as a once-common problem becomes exceptional, and the media advantage of bad news.

Culture Mechanics does not adopt the universal inverse relation as a law. It extracts the narrower candidate mechanism **contrast-amplified residual salience**: remaining cases can become more perceptually and publicly prominent against an improving background even while their incidence or relative severity falls.

```
declining or increasingly exceptional incidence
+ weak public knowledge of the historical baseline
+ stronger contrast of each remaining case against the improved background
+ novelty, moral attention, reporting access, or bad-news selection
→ public salience may rise while incidence falls
```

The mechanism differs from ensemble selection and salience laundering because it can arise without fabricated cases, a coordinated selector, or a false public claim. It becomes epistemically defective when increased salience is used as evidence that incidence, trend, or comparative priority increased while stable definitions, denominators, independent series, observation intensity, severity, and the improving baseline are withheld from practical correction. It can also join endogenous observation: a more visible residual problem can attract a larger reporting apparatus, whose changing output is then mistaken for a stable measure of the world.

The diagnostic therefore compares:

Surface	Required comparison
Definition and denominator	Did the category, population, time unit, or severity threshold change?
Incidence and severity	What happened to absolute count, rate, distribution, and harm, rather than attention alone?
Observation intensity	Did detection, reporting access, publicity, staffing, or classification effort change?
Historical baseline	Is the present case evaluated against a known longer trend or only against recent memory?
Attention-to-incidence relation	Did coverage, campaigns, or institutional attention rise faster than independently measured incidence?

Surface	Required comparison
Residual contrast	Did remaining cases become more conspicuous precisely because the surrounding norm improved?
Correction	Can an independently supported improving trend alter the public claim, priority, remedy, funding, or jurisdiction?

Concern can rise because previously ignored harm finally becomes visible, because knowledge improves, because a lower but still severe residual becomes more tractable, or because moral standards legitimately tighten. A declining rate does not make the remaining victims unreal or unimportant. The candidate detects a divergence requiring explanation; it does not prove exaggeration, manipulation, pretext, un-reality, or an unwarranted remedy.

Report-to-reality laundering and endogenous observation **report-to-reality laundering** *noun phrase*

endogenous observation *noun phrase*

ascertainment ratchet *noun phrase*

salience laundering *noun phrase*

Status: proposed mechanisms and diagnostic distinctions

Report-to-reality laundering is the loss of inferential boundaries by which records produced by a reporting apparatus acquire the authority of independently established reality without the required transformations having been tested:

```
submission
   → admissible report
   → unique alleged incident
   → plausibly classified incident
   → verified case
   → prevalence estimate
   → politically material problem
   → necessary and fitting intervention
```

Each arrow poses a separate empirical or normative question. The number of submissions initially measures submission activity. The number of accepted reports measures a product of events, observation, access, willingness to report, intake design, classification, operator practice, duplication control, and error. It does not by itself measure the underlying incidence of the named phenomenon. A useful qualitative schema is:

```
observed records
  = underlying events filtered through detection, reporting, and classification
  + duplicates and false positives
  − missed, rejected, or inaccessible events
```

This is **endogenous observation**: the measuring apparatus and the social roles around it help produce the observed series. Changing publicity, portal access, definitions, staffing, incentives, trust, fear, or enforcement can change the record count while underlying incidence is stable. Conversely, stable or falling counts can coexist with a worsening phenomenon if reporting or detection falls. The correct inference therefore needs denominators, definition stability, observation intensity, verification outcomes, error estimates, and rival explanations wherever they can be obtained.

Performative change and sensor change must remain distinct. A representation can genuinely alter conduct while measurement remains independent. An observer can change categories, selection, or reporting intensity without materially changing the underlying condition. Both can occur together. Endogeneity changes what the observation proves; it does not establish fabrication or make the observed condition unreal.

Performative historical self-concealment

Performative historical self-concealment occurs when representation-induced changes become ordinary practice and the provenance of the resulting social state recedes from available memory:

```
representation alters conduct, relationships, institutions, or sensing
→ the altered operation produces durable relations, records, and expectations
→ initiating conditions recede from common memory
```

```
→ later observers encounter the produced state as their starting reality
→ the state appears to validate the account that helped produce it
```

Later hostility, trust loss, segregated networks, institutional weakness, or administrative failure can be genuine. The missing object is the history of the data-generating and relationship-generating process. No fabricated dataset, continuing strategist, or coordinated concealment is required. Deliberate concealment is a separate attribution that needs evidence of actor, access, action, temporal nexus, and causal contribution.

The mechanism also prevents the opposite simplification. Historical production does not make the successor condition unreal, costless, or safely reversible. Once relations, skills, records, incentives, and institutions have changed, the produced state can constrain later participants who neither chose nor know its origin. Recovery may require reconstructing carriers and trust rather than merely withdrawing the initiating representation.

An **ascertainment ratchet** arises when apparatus growth raises recorded volume, the rise is read as proof that the external phenomenon grew, and that reading authorizes further apparatus growth:

```
more attention, access, incentives, or intake capacity
                    ↓
             more submissions
                    ↓
 interpreted as more underlying harm
                    ↓
 more attention, access, incentives, or intake capacity
```

The ratchet becomes **resource-coupled** when the observed series also helps determine the observer's funding, staffing, prestige, jurisdiction, or continued existence. The measuring institution then has a material interest in the output whose meaning it helps define. That conflict can bias outreach, thresholds, classification, verification, retention, publication, and resistance to correction without any fabricated entry. It also increases the opportunity and incentive for deliberate metric manipulation. Conflict and vulnerability require disclosure and safeguards; they do not establish manipulation, legal fraud, or false incidence by themselves.

The loop can begin with a real and serious problem. Its defect lies not in looking but in treating the results of intensified looking as though the observation process had remained unchanged. It becomes correction-resistant when rising counts justify expansion, falling counts prove success, low verification invokes an unknowable dark figure, and unavailable records invoke privacy in a way that leaves no possible result capable of counting against the apparatus or its public claim.

Salience laundering is a neighbouring priority transformation:

```
true or plausible event
   → recurrent phenomenon
   → large or growing problem
   → problem deserving scarce public attention now
   → priority over displaced problems
   → necessity and proportionality of the proposed remedy
```

The truth of the first item cannot validate the later arrows. Attention is scarce; concentrated collection and repeated coverage can make selected events cognitively available while larger, less narrated harms recede. Multiple media repetitions of one release, dataset, campaign, or wire report measure propagation and visibility, not independent source confirmation or prevalence. This creates a route by which individually true stories can assemble a materially false picture of the world.

Audit the claim across its full communication chain–technical report, executive summary, press release, journalistic or broadcast translation, political citation, and funding or mandate use–rather than treating the source artifact as the only operative statement. A methodological qualification has **operative correction weight** only insofar as it constrains the consequential comparison, headline, prevalence claim, priority judgment, or intervention that travels downstream. Where a narrow technical qualification remains available under scrutiny while an uncaveated larger implication repeatedly performs the mobilizing work, test the motte-and-bailey amplitude shift rather than counting disclosure alone as successful correction. Trace source genealogy as well: many prestigious repetitions of one operator-controlled dataset or release increase reach and borrowed authority, not source independence.

The complete failure sequence can therefore combine four distinct operations:

1. **moral pre-authorization** – the protected end and virtuous reporting role make scrutiny of the apparatus feel suspect;

2. **procedural insulation** – authentication, categorization, rejection, duplication, conflict, and custody cannot be adequately inspected;
3. **statistical or semantic laundering** – submissions become cases, identities, prevalence, or trend claims without supported bridges; and
4. **political laundering** – the public problem appears to compel a measure whose effectiveness, proportionality, target, and opportunity cost remain unproved.

None of the four is inferred merely from anonymity or confidentiality. Anonymous reporting can protect vulnerable people and produce verifiable evidence. Privacy can justifiably limit public disclosure of personal data. But **privacy for persons must not become secrecy for institutions**: an operator that invokes privacy should still support privacy-preserving independent audit of intake, authentication where promised, duplicates, category rules, dispositions, error, conflicts, source lineage, and corrections. The accused or adversely classified person also needs notice, an intelligible allegation, a meaningful reply route, and proportionate adjudication wherever sanctions or consequential public claims attach.

The defeat conditions are correspondingly operational. A reality-anchored system predeclares what would reduce confidence, distinguishes allegations from findings, publishes stable definitions and denominators, measures observation changes, permits independent confidential audit, records corrections, separates collection from certification where feasible, and allows failed remedy predictions to change the policy. A system does not become un-real merely because it has false positives, imperfect data, moral language, or disputed priorities. Un-reality requires that the representation acquire operative authority while these correction routes no longer reliably alter its use.

When this mechanism appears inside a PGS inquiry, use the typed machinery-routing pass to return these findings to the separate bearer, governor, collision, correction, and reproduction or succession gate. The existence of a real underlying problem neither validates a particular submission-to-trend inference nor defeats a PGS finding about the function that produces or communicates that inference; conversely, a defective measurement route does not establish that the underlying problem is absent.

Mythology Construction owns the role grammar that recruits the virtuous observer and guardian; *Epistemic Agency* owns the citizen-sensor and internal-observer consequences; and *Culture Program Ecology* owns the institutional audit, safeguards, and bounded judicial example.

Post-disclosure un-reality: correction nullification and procession inertia **post-disclosure un-reality** *noun phrase*

defeated-but-operative un-reality *noun phrase*

correction nullification *noun phrase*

Status: proposed state and mechanism distinctions

The section uses four stages that must not be collapsed:

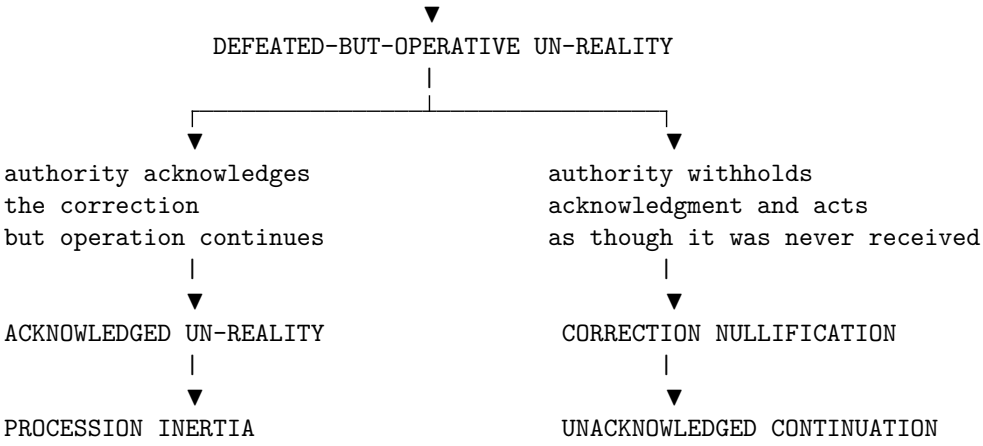

```
corrective input
→ independently sustained epistemic correction
→ reception, answer, and adjudication
→ operative revision and repair
```

A **corrective input** is a challenge, complaint, contradiction, adverse record, or proposed counterevidence. It becomes an **independently sustained epistemic correction** only when the relevant tests preserve it against serious rivals. Reception, answer, and adjudication determine what an authorized route does with that correction. **Operative revision and repair** are later practical effects. Correction nullification therefore does not mean cancellation of an already completed course correction. It means that an epistemically sustained correction is prevented from becoming consequential.

Post-disclosure un-reality is the phase in which a material contradiction has become publicly speakable and inspectable while the challenged representation retains operative reality-status. Disclosure alone does not show that the correction is true or decisive. **Defeated-but-operative un-reality** is the stronger case in which the correction has survived the relevant independent tests and defeated the representation epistemically, but has not displaced its classifications, commands, allocations, procedures, or other practical jurisdiction.

Two branches must be separated:

```
TRUTH BECOMES PUBLICLY SPEAKABLE AND SURVIVES INDEPENDENT TEST
                                |
```

In **acknowledged un-reality**, the relevant authority concedes or otherwise accepts the correction while the defeated representation remains practically operative. **Procession inertia** names the persistence of the associated conduct through roles, procedures, dependencies, sunk commitments, face-saving, absent stop rules, or other organizational momentum. The emperor's inward recognition in Andersen's tale belongs to this branch.

Correction nullification names the other mechanism: an independently sustained correction can be uttered, preserved, and even widely known, yet the relevant actor or receiving system withholds reception, answerability, adjudication, or uptake and continues as though the correction had never entered the institutional control loop. The mechanism may involve deliberate stonewalling, agenda exclusion, non-recording, delay, repetition of the prior script, distributed non-response, or an emergent failure of responsibility. The term itself does not establish which mechanism, one bad actor, coordinated intent, or a complete systemic-lying constitution.

The correction interface is therefore a chain rather than one speech event:

SPEAK
- → RECORD
- → RECEIVE
- → ANSWER
- → ADJUDICATE
- → CHANGE OPERATION
- → REPAIR

A failure after *Speak* can turn a protected liberty into a **dead-letter correction**: the message exists but possesses no institutional receiver capable of making it consequential. *Record* protects against retrospective erasure; *Receive* assigns custody; *Answer* makes an authority state its judgment and reasons; *Adjudicate* prevents that authority from being its own final judge; *Change operation* transmits the result into relevant classifications, action, resources, jurisdiction, personnel, or rule; and *Repair* addresses reversible past consequences. These stages are diagnostic distinctions, not a demand that every true statement compel every listed outcome.

One actor-interface route is **selective civil-personhood breakdown**. The officeholder receives enough of the challenge to deny, evade, reinterpret, forget, or defend, while preventing it from binding present execution through authorship, promise, contradiction, answerability, repair, or consequence. This route differs from biological non-reception. The person may hear, speak, argue, and continue governing; what fails is the binding return path by which warranted correction should constrain the role.

The two principal post-disclosure routes can therefore coexist without becoming synonyms:

Route	What has become available	What remains blocked
Emperor or procession route	The relevant authority acknowledges the correction, or the contradiction becomes common practical knowledge	Acknowledgment does not stop or revise the operative procession
Selective-non-answerability route	The challenge reaches the officeholder sufficiently for denial, evasion, reinterpretation, forgetting, or defence	Authorship, promise, contradiction, answerability, repair, and consequence do not bind continued execution

A system can combine them: the contradiction can be publicly obvious while the officeholder remains personally non-answerable and the surrounding procedures continue the course.

Distributed realization without uniform belief

A correction-nullifying order need not be reproduced by one psychological type. Its **distributed answerability-realization profile** records the complementary person, role, and institutional functions through which an authorized account can remain operative:

Position or function	Possible contribution
Sincere authority-gated believer	Accepts authorized claims and discounts correction arriving outside the trusted route.
Rationalizing defender	Converts contradiction into another reason to preserve the authorized account or programme.
Private doubter and public conformist	Reproduces required speech or conduct without private conviction.
Strategic or role-obedient transmitter	Selects, repeats, records, or enforces the account because of task, incentive, or office.
Trusted carrier	Preserves source standing and supplies the interpretation through which others receive the contradiction.
Institutional custodian	Prevents an adverse finding from changing records, classifications, decisions, jurisdiction, or succession.

These are overlapping and revisable functions, not fixed person-types. No participant must design, believe, defend, transmit, enforce, and reproduce the whole relation. Private assent and operative compliance therefore remain independent variables: a person may believe and comply, disbelieve and comply, believe but resist a particular implementation, or reject and refuse it. The constitutional pattern is not falsified merely because authority-gated belief is rare if role, record, career, and institutional compliance still make the defeated account operative. Private disbelief does not by itself establish epistemic adulthood: a doubter may remain unable to inspect the trust architecture or simply transfer unconditional deference to a rival gatekeeper.

Testing this profile requires matched comparisons of the actual functions: authorization before evidence, asymmetric scrutiny, source insulation, private and public divergence, role enforcement, and the depth of consequential uptake. Compare relevant domains, roles, institutions, or periods while accounting for verification cost, complexity, stakes, information, and competence. The control is a corrigible institution under comparable constraints, not an imaginary population of perfectly independent fact-checkers. Repeated adverse findings that remain inspectable, revise prestigious carriers, leave dissenters' standing intact, narrow failed models, and change the programme itself count against the proposed closure. They must not automatically be redescribed as a more sophisticated performance of openness.

Public conformity can also corrupt **public epistemic telemetry**: participants observe the ritual assent that their own conformity helped manufacture, underestimate dissent, and update from an apparent consensus that no longer measures the field's private judgments. This is one route by which private disbelief can coexist with continued public domination.

Nils Brunsson's organized hypocrisy supplies a neighbouring organization-level mechanism: talk, formal decisions, and action can diverge while answering conflicting demands. The project application is the **compensatory-undertaking hypothesis**: a promise or decision in one direction may manage opposition, preserve legitimacy, or compensate an audience while action continues in another direction, so the undertaking functions as an organizational product rather than a binding constraint on execution. This stronger relation must be established from sequence, audience, reliance, and operative effect in the case; contradiction alone proves neither insincerity nor a hidden principal.

The public performance can then acquire **performative impunity**: repeated visible survival after established contradiction, broken undertaking, or failed answerability demonstrates that ordinary truth, shame, and accountability signals do not presently govern the role. This is an observed relation between failure and consequence, not proof that the actor intended a demonstration. Its experienced result can be **epistemic humiliation**—the public is made to experience that knowing better has no steering force—and **civil humiliation**— ordinary practices of promise, contradiction, answer, and consequence are shown to lack reciprocal purchase on the governing interface. The terms name the relation and experience; humiliation as a chosen objective requires separate actor evidence.

Recovery therefore requires more than renewed assertion. An answerable institutional route must preserve the record, assign custody, require reasons, enable independent adjudication, transmit the result into operative revision, and make repair and bounded consequence possible. Where the officeholder cannot or will not perform those functions, lawful delegation, recusal, supervision, removal, succession, or a separately authorized receiver can restore consequential answerability without demanding confession, humiliation, or surrender of unconditional human standing.

The difference among the maintaining mechanisms is compact:

> **Un-reason neutralizes what the correction means. Correction nullification neutralizes what the correction can do.**

The common staged relation is:

```
COUNTEREVIDENCE
      |
      ▼
epistemic recognition
      |
      ├─ blocked by un-reason
      |     → "this contradiction cannot count"
      |     → no authoritative correction is formed
      |
      ▼
publicly sustained correction
      |
      ▼
institutional reception and uptake
      |
      ├─ blocked by correction nullification
      |     → "act as though this was never received"
      |
      ▼
operative revision and repair
```

Counterevidence becomes a **publicly sustained correction** only after the relevant independent tests have preserved it; public repetition alone is not enough. Un-reason can protect an operation one level earlier by preventing counterevidence from acquiring the status of a valid correction. Correction nullification can protect it one level later by preventing an already available correction from changing operation. This is a common sequence, not an invariant temporal law. If un-reason succeeds completely, there may be no recognized correction left to nullify; correction nullification can also operate through silence, custody failure, incentives, or authority without an elaborate inferential defence.

> **Un-reason prevents counterevidence from becoming a correction; correction nullification prevents a correction from becoming a consequence.**

In the deliberately maintained bad-actor variant:

> **The actor does not need to defeat the truth intellectually if the surrounding machinery can deprive it of consequences.**
>
> **The lie no longer governs belief; it still governs conduct.**

Where a field of trusted or authoritative carriers continues the old classification while withholding uptake, the receiving-side failure can be distributed. One speaker's non-acknowledgment then receives reinforcement from the surrounding field, and the public correction lacks an organ through which it can become action. This is compatible with the trusted-opinion-leader receiving-field function, including its possible **trusted-carrier correction lock**, but neither field coherence nor disagreement proves a culpable choir.

Procedural correction conversion **procedural correction conversion** *noun phrase* **Status:** proposed correction-interface mechanism

Procedural correction conversion occurs when an adverse correction signal is validly expressed, received, recorded, and perhaps accurately counted, but the operative procedure converts that signal into failure to revise the challenged

rule, decision, office, authorization, or course. The correction is neither semantically defeated nor necessarily ignored. Its institutional effect is transformed:

```
adverse correction is validly expressed and recorded
→ threshold, default, timing, agenda, quorum, routing, expiry, or restart rule
→ correction fails to trigger operative defeat or revision
→ challenged operation continues
```

This is a subtype of failed consequential uptake but differs from the strict non-reception branch of correction nullification. The receiver may acknowledge the correction and count every vote correctly. The fault lies in the configured relation between the signal and what the signal is permitted to change:

Mechanism	Correction status	Operative failure
Correction nullification	Withheld from reception, answer, adjudication, or uptake; treated as though it never entered the control loop	The correction is denied an operative receiver or consequence
Procedural correction conversion	Formally received, recorded, and processed	Procedure translates the adverse result into continuation, default, failed rejection, or a new authorization opportunity
Legitimate heightened threshold	Received and processed under a stable, prospective, reciprocal rule serving an independently defensible constitutional allocation	No correction failure follows merely because an ordinary majority cannot alter a protected settlement

Possible conversion operators include an absolute rather than votes-cast majority, a strategically consequential quorum, adverse default rule, agenda exclusion, accelerated timetable, serial resubmission, formal repackaging that resets an earlier defeat, or a route that changes which body or threshold controls. None is pathological by form alone. Supermajority rules, bicameralism, judicial review, limitation periods, and agenda rules can protect persons, stability, deliberation, federal allocation, and minority standing.

Diagnostic force rises when:

- the route or threshold changes after the adverse result or its likely outcome is known;
- formally new packaging preserves substantially the same operative object;
- timing predictably converts absence or compressed preparation into support for continuation;
- an instrument justified as accelerating implementation of the deciding body's will is used to bypass or reverse that body's already expressed will;
- repeated defeat produces procedural redesign rather than substantive revision;
- the affected opposition can speak and be counted but cannot obtain answer, ordinary deliberation, adjudication, or a route to operative change; or
- aligned results receive ordinary-majority effect while adverse results face a movable or exceptional burden.

The observable conversion and the attribution of a **procedural trick** must remain separate. A rule can have an anti-corrective effect through stable design, error, inherited procedure, path dependence, or an unforeseen interaction. Strategic exploitation requires additional chronology, knowledge, alternative- route, actor, and counterfactual evidence. Accurate counting therefore defeats a vote-falsification allegation but does not by itself establish that the complete correction interface was democratic, reciprocal, or corrigible.

The compact rule is:

> **A correction can be counted correctly yet converted procedurally into no correction. Audit not only whether the signal was registered, but what the governing procedure allowed it to change.**

Auxiliary-un-reality explaining-away cascade **auxiliary-un-reality explaining-away cascade** *noun phrase*

Status: proposed mechanism

An **auxiliary-un-reality explaining-away cascade** occurs when collision between an operative un-real representation and reality generates a new authorized causal representation that explains away the correction, protects the original account, and may itself acquire operative authority.

Call the protected representation **U0**. An **auxiliary un-real representation** is a later account **U1** whose operative role is to preserve U0 against a reality-contact event that should otherwise correct it. An **adverse auxiliary un-real representation** is the important subtype that assigns adverse agency, guilt, bias, pathology, disloyalty, obstruction, or dangerous status to the critic, dissenter, observer, victim, or another selected target. It can therefore both immunize U0 and authorize new exclusions, burdens, sanctions, or jurisdiction.

```
REALITY-CONTACT EVENT
failure · harm · contradiction · exposed falsehood
          |
          ▼ threatens
EXISTING OPERATIVE UN-REALITY U0
          |
          ▼
new authorized adverse auxiliary account
          |
          ▼
ADVERSE AUXILIARY UN-REAL REPRESENTATION U1
"resistance caused the harm" · "saboteurs caused the failure"
"the observer is biased" · "the critic proves the diagnosis"
          |
          ▼
trusted carriers authorize, translate, and distribute U1
          |
          ▼
U1 explains away the correction threatening U0
          |
          ▼
U0 remains operative + U1 acquires classifications and consequences
          |
          ▼
ORGANIZED UN-REALITY EXPANDS: U0 + U1 + U2 + ...
```

Ordinary Bayesian explaining-away

Where causes compete to explain an observation, independent evidence for one cause can rationally reduce the explanatory burden or probability assigned to another:

```
observed outcome O
        |
        +--> possible cause A
        |
        +--> possible cause B

new evidence E independently supports B
        |
        v
where A and B compete for explanatory share,
confidence in A may rationally decrease
```

Explaining-away remains reality-answerable when:

- the alternative has evidence independent of its usefulness in protecting a favoured account;
- the causal model, observations, priors, and rival explanations remain inspectable;
- comparable standards apply to favoured and disfavoured causes;
- the explanation makes predictions or otherwise exposes itself to defeat; and
- every candidate cause and the larger model can lose when further evidence warrants it.

An alternative is not un-real or un-reasoned merely because it preserves an earlier conclusion, is proposed after an unexpected event, or attributes responsibility elsewhere. Legitimate causal revision is indispensable to truth-seeking.

Counterfeit Bayesian explaining-away

The phrase **counterfeit Bayesian updating** names the project's diagnostic contrast, not a new probability calculus and not a claim that participants compute explicit probabilities. The counterfeit form treats the authorization, identity fit, or programme usefulness of U1 as though it were independent evidence for U1. The auxiliary account is introduced or privileged after the collision, receives asymmetric evidential protection, and is used to cancel the correction that occasioned it:

```
operative U0 collides with reality
        |
        v should weaken or correct U0
U1 is introduced or privileged
        |
        v
authorization or programme usefulness substitutes
for adequate independent causal evidence
        |
        v
U1 receives asymmetric evidential protection
        |
        v
U1 explains the correction away
        |
        v
U0 remains operative; U1 may acquire classifications,
burdens, sanctions, and authority of its own
```

The diagnosis requires the full operative relation: U0 already has practical reality-status; relevant reality contact threatens it; U1 lacks adequate independent support or is shielded from reciprocal testing; authority gives U1 corrective priority; and U0, U1, or both continue to classify and allocate despite failed correction. A merely post-hoc explanation, adverse attribution, weak hypothesis, disputed model, or ordinary update does not establish the mechanism. A genuine logical contradiction cannot be dissolved by inventing another cause; premises, scope, authenticity, or the claim itself must be corrected.

The cascade types the relation among the surrounding constructs:

Construct	Role in the cascade
Linguistic tricks	Can supply the wording and reconstructive operations of U1 through selective framing, psychologizing, burden reversal, scapegoating, moral inversion, or script preactivation.
Instrumental untruthfulness	Can select, retain, suppress, or route U1 principally for its operative effect over faithful causal representation.
Un-reason	Constructs or accepts the auxiliary causal model that protects U0 from the meaning of the correction.
Un-real representation	U0 retains operative reality-status through failed correction; U1 becomes another un-real representation if it acquires such authority under the same failed-correction relation.
Trusted-carrier correction lock	Gives U1 receiving-field credibility, gain, translation, and distributed routing.
Correction nullification	Possible result: the sustained correction cannot change operation.
Systemic lying	Can recurrently generate U1, U2, U3, and later defensive accounts when installed representations collide with reality.
Organized un-reality	The accumulating installed stock of U0 and its operative auxiliaries.

The mechanism is neither necessary for correction nullification nor sufficient for systemic lying. A correction can be nullified by silence or custody failure; one weak post-hoc explanation can remain corrigible. The stronger

classification requires recurrence, authorization, asymmetric correction, practical jurisdiction, and the separately specified constitutional scale.

> **Reality supplies the correction; organized un-reality supplies another un-reality to explain it away.**

Persuasion or confession by the incumbent carrier is not the only possible exit. **Bounded de-authorization** removes a defeated representation's or specified carrier-function's authority over the affected decision without requiring the human occupant to convert, confess, or lose person-standing. Depending upon the lawful jurisdiction, this can operate through independent adjudication, predeclared automatic consequences, succession or removal from a bounded office, withdrawal of a specified classification or enforcement power, protected refusal, parallel institutions, or jurisdictional separation. The carrier may retain speech, belief, association, due process, appeal, and every authority not properly placed in issue.

> **The alternative to converting the opponent is de-authorizing the opponent's power to make everyone else inhabit the defeated account.**

Bounded de-authorization is not a licence for a self-appointed truth authority, collective punishment, cultural reprogramming, or extra-legal coercion. It requires a specified representation and jurisdiction, independently testable grounds, authorized procedure, proportionality, review, appeal, and repair. If no reception, adjudication, lawful succession, de-authorization, refusal, parallel route, exit, or jurisdictional separation survives at an unavoidable common decision, the interface may approach the separately gated secession-or-force fork.

The constitutional lesson is:

> **A fact regains public authority not merely when it becomes speakable or even officially acknowledged, but when it is capable of altering every downstream operation whose justification materially depends upon it.**

Typed epistemic architecture: operation, orientation, mechanism, state, stock, and constitution The surrounding terms identify different analytical objects and must not be used as synonyms:

Term	Analytical type	Governing question
Linguistic trick	Local communicative operation	How is an audience's reconstruction steered while enough of the appearance or authority of communication remains?
Instrumental untruthfulness	Communicative selection orientation	Is communication selected, shaped, retained, suppressed, or routed for operative effect while truth-supporting conditions become subordinate?
Un-reason	Inferential, interpretive, or correction-defeating mechanism	Has conclusion-protection taken control of the machinery and standing of reason?
Un-real representation	Operative epistemic state or output	Does an authorized representation continue to govern consequential conduct although independent correction cannot alter its authority or use?
Organized un-reality	Installed multi-channel stock	Have human, linguistic, symbolic, incentive, record-bearing, and institutional channels become fitted around one or more un-real representations?
Systemic-lying epistemic constitution	Constitutional meta-order and truth-orientation pole	Does the order recurrently generate, select, authorize, protect, and replace organized un-reality rather than preserve reality's authority to defeat it?

The shortest synthesis is:

Linguistic tricks are possible communicative operations; instrumental untruthfulness is the orientation that selects communication for effect over truth-supporting conditions; un-reason is captured inferential control logic; un-reality is a possible operative social state; organized un-reality is its fitted multi-channel stock; and systemic lying is the constitutional production-and-maintenance regime.

Ideology is not a seventh epistemic level or another name for the sequence. It is a Culture Program classifier that requires a particular fitted conjunction across these levels: reusable generation, authorized social un-reality, failed operative correction, un-reasoned defence, sufficient installation and reproduction, and collective scale. Un-reason, organized un-reality, or systemic lying alone does not establish that conjunction; **Systemic Ideology** is one candidate route into, but not a synonym for, the systemic-lying pole.

Distributed carrier sequence The **distributed carrier sequence** is a possible cross-scale pathway through which a selected communicative form becomes a recipient's reconstructed model, may recruit a person's or institution's reasoning, may acquire operative authority, and may eventually enter constitutional reproduction. It is *distributed* because different people, roles, offices, records, incentives, and institutions can carry different functions. No single participant must design, understand, believe, defend, record, enforce, and reproduce the whole relation.

```
ORIGINATOR OR SELECTOR
creates, selects, retains, suppresses, or routes a communicative form;
instrumental untruthfulness may govern the selection
                          |
                          v
CARRIER
repeats, translates, condenses, amplifies, or performs it
strategically, habitually, role-obediently, or sincerely
                          |
                          v
RECIPIENT RECONSTRUCTION
the recipient reconstructs a factual, causal, moral,
identity, or authorization model rather than merely copying words
                          |
                          v
POSSIBLE UN-REASON
reasoning protects the reconstructed model when correction threatens it
                          |
                          v
POSSIBLE UN-REALITY
the model receives or retains consequential operative authority
despite failed independent correction
                          |
                          v
POSSIBLE ORGANIZED UN-REALITY
records, classifications, procedures, offices, incentives, symbols,
and sanctions become fitted around the operative representation
                          |
                          v
POSSIBLE SYSTEMIC LYING
a constitutional meta-order recurrently selects, authorizes,
protects, reproduces, and replaces the installed stock
```

The first three positions concern communication and reconstruction. The later terms are not additional human roles: *un-reason* is a possible inferential mechanism, *un-reality* an operative state, *organized un-reality* an installed stock, and *systemic lying* a constitutional meta-order. The sequence therefore connects levels without collapsing them.

Position or transition	Governing question	Attribution and correction boundary
Originator or selector	Who created, selected, retained, suppressed, or routed this form, and why?	Deliberate instrumental selection requires actor-level evidence. A form can also originate in sincere error or be selected institutionally because it performs well without one represented design.
Carrier	Who transmitted, translated, condensed, amplified, or publicly performed it?	Transmission does not carry the originator's intent automatically. Compare the carrier's source access, fidelity, incentives, role, private–public relation, and response to correction.
Recipient reconstruction	Which factual, causal, moral, identity, or authorization model did the recipient actually reconstruct?	Exposure is not adoption. Test comprehension, retained distinctions, alternative readings, source trust, local-bigOther fit, and whether conduct or judgment changed.
Reconstruction → un-reason	When challenged, does reasoning permit the reconstructed model to lose?	Belief, confidence, emotion, or one weak defence is insufficient. Require protected conclusions, asymmetric standards, recursive immunization, and failed correction for the specified unit, claim, domain, and period.
Un-reason → un-reality	Did the protected model acquire or retain authority over consequential conduct?	Private rationalization alone is insufficient. Identify records, classifications, decisions, permissions, burdens, sanctions, resources, or jurisdiction that remain governed despite failed correction.
Un-reality → organized stock	Did several human, symbolic, record-bearing, incentive, and institutional channels become fitted around it?	One operative error is insufficient. Require multi-channel installation, recurrence, and evidence that the channels reinforce or preserve the representation.
Organized stock → systemic lying	Does a constitutional meta-order recurrently generate, select, authorize, protect, and replace the stock over independent correction?	Domain-specific or temporary organization is insufficient. Establish the specified order, scope, period, recurrence, correction hierarchy, and constitutional production relation.

The most important attribution rule is:

Intent does not propagate merely because a message does.

One actor may knowingly construct a misleading frame, another may repeat it as a job requirement, a third may sincerely believe it, a fourth may use un-reason to defend it, and an office may record and enforce it without any participant possessing a complete model of the cycle. Conversely, a sincere originator or carrier does not make the resulting representation reality-answerable. The classification follows the evidenced operation at each position, not moral contagion from another position.

Nor does *distributed* imply conspiracy or coordination. Selection pressure, prestige, role segmentation, common training, shared records, institutional memory, ordinary conformity, and independently similar incentives can produce convergent transmission. Coordination, covert design, capture, guilt, and person-level deception require their own evidence.

A carrier may occupy the trusted-opinion-leader function, in which case trust and gain can increase routing, uptake, translation, and returned reinforcement. But ordinary carriers also suffice for transmission; carrier status alone establishes neither trusted gain nor a trusted-carrier correction lock.

A neutral worked example makes the distribution visible:

```
An organization suffers a preventable failure.

Selector:
an external-sabotage account is selected because it protects incumbent authority.

Carriers:
officials and commentators repeat it; some may doubt it,
some follow their role, and some believe it sincerely.

Recipients:
some reconstruct a model in which criticism itself signals hostile interference.

Possible un-reason:
contrary evidence is redescribed as proof of the saboteurs' sophistication.

Possible un-reality:
the sabotage account governs investigations, records, appointments,
sanctions, and future policy despite failed correction.

Possible organized un-reality and systemic lying:
procedures and incentives preserve the account, and later failures
recurrently generate authorized successor sabotage accounts.
```

Sabotage can of course be real. An independently supported, reciprocally tested, predictively exposed sabotage explanation is ordinary causal inquiry, not this pathology. One mistaken explanation, one sincere repetition, or one failed correction also does not establish the later stages.

Every position and arrow is therefore a separate evidential and intervention point. At selection, inspect provenance and disclose the selection rule; during transmission, test carrier fidelity, refusal, and source comparison; at uptake, check the recipient's reconstruction and alternatives; when defence begins, restore reciprocal defeat conditions; when the model acquires authority, use operative review and bounded de-authorization; during installation, preserve channel independence and repair; and at constitutional scale, preserve pluralism, succession, and reality-answerable correction. A break at any point can prevent this pathway from propagating.

This is one possible causal sequence, not a mandatory ladder. None of the following implications is valid without further evidence:

```
one linguistic trick       -/-> instrumental untruthfulness, un-reason,
                                  un-reality, or systemic lying
localized un-reason        -/-> un-reality or systemic lying
one un-real representation -/-> organized un-reality or systemic lying
organized un-reality       -/-> whole-order systemic lying
```

A linguistic trick can be exposed and corrected. Un-reason can remain local to one person, argument, discipline, office, or protected claim. Un-reality can arise or persist without un-reason through censorship, omission, ritual assent, synchronized incentives, memory loss, authority, coercion, correction nullification, or organizational inertia. Systemic lying can preserve an authorized account with little sophisticated reasoning. A domain-specific stock of organized un-reality can remain bounded and corrigible from outside.

The non-collapses are therefore strict:

```
linguistic trick             != instrumental untruthfulness
linguistic trick             != un-reason
instrumental untruthfulness  != un-reason
un-reason                    != un-reality
un-reality                   != organized un-reality
organized un-reality         != systemic lying
```

```
systematic actor-level lying  != systemic lying
systemic lying                != Ideology or another Culture Program
                                 classification by itself
reasonable critical discussion != established truth
```

Systematic lying is repeated or methodical deceptive conduct attributed to a specified actor or organization. **Systemic lying** is a constitutional truth orientation that can be reproduced by deliberate deceivers, sincere believers, conformists, officials, roles, incentives, and institutions together. Systematic lying can contribute to the systemic order but is neither necessary nor sufficient for it.

Cross-axis comparisons must hold the **specified unit and level** constant. For a person, outward communication selection and the person's own correction logic are different objects; for an institution or programme, output-selection rules and institutional correction rules are different relations within that unit. Strategic public communication does not establish private un-reason, and institution-level selection does not establish actor-level instrumental intent. Sincerity also remains distinct from truth-content and reality-tracking.

Analysis should consequently ask six separate questions:

1. **Communicative form and operation:** Which linguistic or reconstructive form occurred, did it operate as a trick in context, and which truth-supporting condition did it affect?
2. **Communicative selection orientation:** Was the communication selected, shaped, retained, suppressed, or routed principally for operative effect, and for which actor, role, programme, or institution is that attribution supported?
3. **Governing inferential logic:** Was reasoning organized so that a specified conclusion, authority, identity, or programme could not lose?
4. **Operative status:** Did the representation receive practical authority, and could independent correction change its use?
5. **Installation and scale:** Was it fitted across multiple channels and recurrently reproduced by a constitutional meta-order?
6. **Intent and attribution:** Who selected, understood, designed, repeated, or inherited which operation, and with what evidence?

This sequence prevents a constitutional diagnosis from being inferred from one euphemism, conscious lying from sincere un-reason, or un-reality from one false but corrigible statement.

The complete relation can be stated in one sentence:

> **Instrumental untruthfulness can select linguistic tricks for their operative effects; those tricks can shape messages through which un-reason protects an authorized account; when failed correction cannot withdraw that account's operative reality-status, it is un-real; when such representations accumulate across fitted channels, they form organized un-reality; and when a constitutional meta-order recurrently generates, selects, authorizes, protects, and replaces that stock, the order approaches or realizes systemic lying. A truth-seeking alternative joins pragma-dialectically reasonable discussion to independent reality-answerability so that every resulting account can still lose.**

10. Communicative integrity and linguistic tricks

The epistemic constitution is enacted at the smallest scale through ordinary speech. It matters whether communication is oriented toward mutual understanding and reality or toward operative effect while preserving the appearance of communication.

This distinction resembles **Jürgen Habermas's** contrast between communicative and strategic action and his differentiation of truth, normative rightness, and sincerity as validity claims in *The Theory of Communicative Action*. The present synthesis borrows this orientation but does not adopt Habermas's entire theory or treat discursive agreement as sufficient for correspondence with reality.

The detailed micro-level taxonomy is maintained separately in *Linguistic Tricks: A Semantic Inventory*. That inventory covers the assertional, informational, semantic, dialogical, attributional, and contextual operations through which communication can obscure rather than illuminate. It also explains the relation between fallacy, sophism, sophistry, and the wider category of instrumental untruthfulness. Its entries are not reproduced here.

Within the typed architecture, a linguistic trick is a possible communicative operation, while **instrumental untruthfulness** is the further selection orientation in which a specified actor, role, programme, or institution privileges operative effect over truth, accuracy, sincerity, shared meaning, reciprocal examination, reasonable resolution, or

correction. One trick does not establish that orientation, and the orientation does not establish un-reason: a strategist can knowingly mislead while privately retaining a corrigible model, while a sincere believer can communicate exactly what the believer thinks and still defend it through un-reason.

Constitutionally, the point is:

> Repeated micro-violations of communicative integrity can accumulate into the normal language, reflexes, public narratives, and institutional practices of a systemic-lying order.

Victor Klemperer's *The Language of the Third Reich* is a major historical antecedent for understanding how repeated official vocabulary can shape categories, habits, emotions, and culture. **Harry Frankfurt's** *On Bullshit* identifies the distinct danger of communication indifferent to whether its content is true. Neither author supplies the complete category of instrumental untruthfulness used in the inventory.

11. Disagreement as social perception

A reality-anchored constitution treats consequential disagreement first as information that the social model may be incomplete—not as contamination to be removed.

Not every propositional disagreement is a conflict between mythologies. *Culture Mechanics*, "Disagreement, mythological rivalry, and cultural-program conflict," distinguishes propositions, causal stories, classifications, informal mythological rivalry, active mythological conflict, competing governing programs, and organized propagative conflict. This constitution is concerned with the correction route across all of them. **Rival-signal suppression** becomes constitutionally dangerous when censorship, channel exclusion, or synchronized institutional classification removes a competing claim before independent judgment can inspect it. The suppressed signal may be wrong, but it may also contain independent evidence, minority perception, or an internal correction.

The proposed **disagreement sensor** performs a limited function:

> "A consequential disagreement exists. Here are the rival propositions and their actual proponents."

It does not determine which side is true. Its positive institutional expression is a deliberately simple **public contestability infrastructure**:

```
DETECT A CONSEQUENTIAL DISAGREEMENT
                    ↓
OFFER ITS PROPONENTS AN EQUAL PUBLIC STAGE
                    ↓
ENABLE DISTRIBUTED PUBLIC OPINION-FORMATION
                    ↓
PRESERVE THE EXCHANGE AND REOPEN IT WHEN REALITY ADDS EVIDENCE
```

The institution is a public sensor, stage, and memory—not a public brain. It performs three primary operations.

11.1 Detect: make the disagreement publicly legible Candidate disagreements can enter through two simple routes:

- **open registration:** anyone may point to two consequential, genuinely incompatible public claims and request that they be placed on a visible public list;
- **attention monitoring:** widely circulating contradictory claims—including claims found in trending social-media posts—can trigger an invitation without any judgment that either claim is respectable or true.

The sensor translates a conflict among persons, affiliations, slogans, or posts into a conflict among propositions. For example:

```
Claim A: X is the principal cause of Y.
Claim B: X is not the principal cause of Y; Z is.
Consequences: the disagreement materially affects policy or public conduct.
Proponents: A1 and B1, or representatives selected by them.
```

The public list should show the proposed wording, why the claims conflict, their public reach or consequence, who has been invited, who has accepted or declined, and when the exchange will occur. Where demand exceeds available stage time, published queues, rotation, or lottery are preferable to an opaque judgment about which position deserves attention. Detection establishes only that **a disagreement exists and matters**. It confers neither truth nor moral endorsement.

11.2 Stage: expose the rival propositions to one another and to everyone The paradigm is television-style in reach, immediacy, and intelligibility to ordinary viewers—not an expert-only institutional process—but without television's declaration that one participant has "won." Its minimal form is:

1. State the opposing propositions plainly and publish the agreed or disputed wording.
2. Give the actual proponents, or representatives chosen by them, equal standing and time.
3. Allow each side to present its own positive case rather than merely answer an opponent's framing.
4. Permit direct questions, answers, rebuttals, and concessions under transparent rules.
5. Display the sources and evidence invoked so viewers can inspect them.
6. Broadcast the complete exchange live or with equivalent mass accessibility.
7. Preserve an unedited recording, searchable transcript, source list, and any explicit predictions or unresolved cruxes.
8. Let no moderator, panel, fact-checking office, audience poll, or institution declare a winner.
9. Leave every position open to later challenge and renewed debate.

The moderator is a custodian of equal opportunity, relevance, answerability, and accurate representation—not a sovereign certifier of truth. The moderator enforces time and speaking rules, prevents interruption, keeps the exchange on the stated propositions, and ensures an opportunity to answer allegations. Fact verification remains useful for authenticating documents, quotations, dates, calculations, and provenance, but it is an instrument available to public inquiry rather than an authority standing above it.

11.3 Public group opinion-making: judgment without an institutional judge After the stage has supplied a common encounter, each observer forms a provisional opinion. Viewers can compare reasons, inspect the displayed sources, discuss the arguments with others, notice different evasions or contradictions, and revise their judgments. People with relevant experience can add observations and counterevidence. Later events can reopen the same disagreement.

The resulting **public group opinion** is not a verdict issued by the hosting institution. It is the changing distribution of many individual judgments after exposure to the same strongest available opposing cases. A poll may describe that distribution, but it must not manufacture an epistemic winner or imply that a majority vote creates truth.

The hoped-for group advantage comes from distributed perception: different observers notice different factual errors, missing premises, rhetorical evasions, trade-offs, and connections to experience. It depends upon access to the full exchange, diversity of perspective, and sufficient independence of judgment. If social pressure tells everyone in advance what a respectable person must conclude, the crowd ceases to supply meaningfully independent observations.

Truth therefore functions as a **centre of gravity**, not as a democratic product. Neither the institution nor the majority owns truth. The institutional contribution is to place rival claims in shared light so dispersed human judgment—and eventually further evidence from reality—can act upon them.

The compact constitutional form is:

> **Detect disagreement → offer an equal public stage → let public opinion form from independent judgments → preserve the record → reopen the question when argument, evidence, or reality warrants it.**

11.4 Concrete prior art—and the missing integration Several existing institutions demonstrate parts of this mechanism:

Prior art	Relevant contribution	Difference from the proposed constitutional organ
DEBATECON / Modern-Day Debate	A flagship in-person conference within a self-described neutral platform that brings opposing positions into public debates on religion, politics, and science. It demonstrates the uncensored, symmetrical public stage.	It supplies the stage, but its published format is not organized around a permanent open process for detecting, registering, and revisiting consequential disagreements.

Prior art	Relevant contribution	Difference from the proposed constitutional organ
Open to Debate—formerly Intelligence Squared U.S.	Precisely framed motions, opposing sides, structured exchanges, mass distribution through broadcast and online media, and a large public archive. Its Oxford-style format gives both sides equal opportunity and polls the audience before and after.	It declares the side producing the greatest audience shift the winner. The proposed organ retains the motion, symmetry, and broadcast reach but treats opinion change only as descriptive public telemetry, not a truth criterion or victory condition.
The Soho Forum	Public one-on-one Oxford-style debates around a clearly stated resolution, with direct engagement, audience questions, livestreaming, and preserved recordings. It demonstrates sustained proposition-versus-proposition confrontation rather than short panel sound bites.	It also defines victory through movement in the audience vote. Its topic selection is producer-driven rather than the output of an open disagreement sensor.
Braver Angels Debates	A structured, non-punitive ethos in which participants articulate what they actually believe, may express nuance or uncertainty, and seek greater understanding rather than vanquishing an opponent.	It supplies part of the sincerity and disagreement ethos, but is designed principally as participatory small-group conversation rather than mass-broadcast public evidence testing.

These comparisons concern the organizations' published formats; they do not imply that the organizations have never experimented with other elements. Their contributions are complementary:

> **DEBATECON supplies the open conference stage; Open to Debate supplies the formal motion and mass-broadcast form; the Soho Forum supplies sustained direct engagement; Braver Angels supplies part of the non-punitive ethos. The proposed public contestability infrastructure joins these to an open disagreement sensor, distributed public judgment without an official winner, preserved evidence, and renewed correction.**

The distinctive integration lies before and after the event. Existing debate producers ordinarily choose a topic and then stage it. A disagreement-sensing constitutional organ makes the detection and fair public processing of emerging consequential disagreement itself a continuing social function. After the event, it preserves the question rather than closing it with a winner.

Pragma-dialectical procedure plus reality-answerability This procedure can borrow from **Frans H. van Eemeren and Rob Grootendorst's** *A Systematic Theory of Argumentation: The Pragma-Dialectical Approach*. Chapter 3, "A model of a critical discussion," pp. 42–68, sets out the ideal discussion through confrontation, opening, argumentation, and conclusion. Chapter 6, "Rules for a critical discussion," pp. 123–157, supplies the procedural rules behind freedom to advance and question standpoints, disclosed burdens, relevant defence, faithful representation, and explicit closure. These provide counter-standards to several linguistic tricks.

The borrowing is partial:

> **Pragma-dialectics supplies internal procedural reasonableness; Culture Mechanics adds external answerability to evidence and reality.**

```
PRAGMA-DIALECTICAL CRITICAL DISCUSSION
fair internal procedure for disagreement
                  +
REALITY-ANSWERABILITY
the resulting account remains corrigible by evidence and events
                  +
COMMUNICATIVE INTEGRITY
sincerity, inspectable meaning, relevance, provenance,
reciprocal burdens, visible dialogue type, and honourable correction
```

=
TRUTH-SEEKING COMMUNICATIVE INTERFACE

A fair discussion can still reach a false conclusion. Conversely, a systemic-lying order can preserve the ceremonies of critical discussion while controlling admissibility, opponents, burdens, consequences, and the conditions under which its authorized account may lose. One breached discussion rule does not by itself establish a trick, instrumental untruthfulness, un-reason, un-reality, or systemic lying.

> **Pragma-dialectics asks whether disagreement was conducted reasonably. Reality-answerability asks whether reality is still permitted to overturn its result.**

The institution is deliberately not a centralized public brain:

> **The institution detects and stages disagreement. The public judges. Reality decides over time.**

Distributed judgment can outperform centralized judgment when observers contribute genuinely different information, perspectives, and heuristics. **Lu Hong and Scott Page's** conditional result in "Groups of Diverse Problem Solvers Can Outperform Groups of High-Ability Problem Solvers" is a relevant formal antecedent, but it must not be inflated into the claim that every crowd is wise. Diversity, sufficient competence, independence, information access, and correction are enabling conditions. A synchronized crowd can amplify shared error.

11.5 Contestability without permanent contest The constitutional requirement is **permanent contestability, not permanent contest**. An open order must preserve the standing, channels, records, procedures, and succession rules through which a consequential challenge can become visible and effective. It need not manufacture a challenge when no relevant mismatch or unresolved disagreement is presently active.

Contestability is maintained partly as a family of constitutional scripts. The scripts for dissent, investigation, appeal, opposition, legitimate loss, succession, correction, and return can remain dormant without being absent. They remain viable when people know the roles, institutions preserve their capacity, interfaces and records remain usable, participants can rehearse or periodically exercise them without manufacturing an enemy, and actual activation sometimes produces effective correction or succession. A formal procedure whose carriers, skills, honour, independence, or material support have disappeared is nominal contestability, not standing capacity.

A lifted and corrigible order may converge toward low activated conflict because evidence has narrowed disagreement, bounded jurisdictions have separated incompatible uses, legitimate procedures have produced accepted decisions, or a successful rebraiding has restored a workable shared order. Truth-directed convergence is allowed to count as convergence. Low conflict is not by itself proof of censorship, preference falsification, or hegemonic foreclosure.

The proposition remains partly open:

> **A strongly lifted and corrigible order is expected to permit low-conflict steady states while keeping correction fully available; whether contestability atrophies unless it is periodically exercised remains an empirical and institutional-design question.**

The relevant distinctions are:

```
quiet because correction worked
≠ quiet because rival signals were suppressed

standing capacity for adversarial correction
≠ continuous production of adversarial identity
```

Possible signs of healthy low conflict include independent evidence routes, low-cost dissent, successful correction of prestigious actors, genuine electoral or institutional succession, and the ability of a new disagreement to obtain a public stage. Signs of concealed closure include punishment of test challenges, loss of opposition channels, edited memory, authority-gated evidence, and calm that depends upon dissenters' silence, exclusion, or exit.

This partly specifies but does not close the atrophy question. Periodic real succession, bounded exercises, independent audits, protected test cases, professional formation, and remembered precedents may maintain a dormant script without continuous antagonistic mobilization. Whether these practices are sufficient, and at what interval and scale, remains an empirical and institutional-design question.

11.6 Censorship as a non-localizing correction-closure sentinel **censorship sentinel** *noun phrase* **non-localizing epistemic-constitutional fault sentinel** *noun phrase* **Status:** proposed diagnostic relation

The **censorship sentinel** is crossed when a public or private power suppresses, criminalizes, makes practically undiscoverable, or disables the consequential uptake of nonviolent, evidence-bearing correction or opposition that does not itself violate a specifiable reciprocal right. It directly detects impairment of the correction architecture. It does not by itself identify the protected representation, Culture Program, mechanism, scale, actor, intention, or complete constitutional diagnosis.

The engineering distinction among fault detection, isolation or localization, and diagnosis supplies the controlled source bridge: detecting a failure differs from locating the implicated component and identifying its failure mode. An ANOVA omnibus test similarly establishes that a difference exists without identifying which means differ. The project applies that relation constitutionally:

```
censorship or disabling of relevant correction
        -> fault detected: plural correction is impaired
        -> localization: which channel, domain, institution, or jurisdiction?
        -> diagnosis: closure, un-reality, un-reason, systemic lying,
                      self-protection, panic, corruption, or another mechanism?
        -> attribution: which actor, objective, knowledge, and causal nexus?
```

This is a **high-likelihood-ratio** claim, not a validated numerical coefficient. A reality-anchored order ordinarily benefits from exposing consequential claims to strong counterevidence, whereas a correction-protecting order benefits from making rival judgment unavailable, dangerous, inaudible, or ineffective. Under the bounded definition above, censorship can therefore make correction-protecting epistemic malfunction substantially more probable without making the remaining diagnoses equiprobable or already proved:

> **High detection power does not imply high localization power. Censorship can sound a strong alarm while leaving the room, fuel, ignition mechanism, and responsible actors unresolved.**

A single censorial operation is an event sentinel rather than an aggregate metric. A measurement system can construct a typed profile from its breadth, viewpoint selectivity, target, timing, legal route, institutional recurrence, private-proxy use, appeal, repair, and effect on correction. The profile must not be collapsed into one scalar score whose aggregate hides the operative route.

Current positive law cannot define the protected side of the test. A power can manufacture the illegality later invoked to exculpate its own suppression:

```
correction threatens an authorized account or power
        -> a prohibition is introduced or expanded
        -> the correction becomes "unlawful"
        -> suppression is defended because only unlawful speech was suppressed
```

Bootstrap illegality, also called **legality laundering** here, names this circular operation. Lawfulness is then an output of the system under diagnosis and cannot serve as its independent defence:

> **Legality does not exculpate censorship when the censorial operation produced the illegality.**

The boundary instead asks whether the restriction attaches to an independently specified reciprocal-right violation. A credible threat, coercion, fraud, non-consensual disclosure of intimate material, or a seriously damaging factual accusation presented as established fact without an adequate evidential basis can be governed as conduct with a concrete rights nexus. Harsh judgment, satire, political criticism, evidenced accusation, good-faith reporting, and a suspicion whose uncertainty and basis are disclosed cannot be converted into such conduct merely because they damage authority or reputation. Generality, symmetry, prospective definition, independent adjudication, proportionality, appeal, and repair remain necessary safeguards, especially when the target possesses public or concentrated private power.

The sentinel has two important temporal positions:

```
PROPHYLACTIC CLOSURE
opposition is disabled before it becomes correction-effective
        -> an authorized representation is easier to install un-really

CORRECTION-CAP REMOVAL
un-reality or systemic lying is already partly operational
```

```
+ surviving opposition remains correction-effective
        -> contradiction threatens authority or use
        -> the surviving channel is treated as an implementation defect
        -> censorship deepens closure and reproduction
```

Its relation to the typed epistemic architecture is correspondingly conditional:

Construct	What the censorship observation can establish
Correction impairment	Directly supported when formulation, publication, discovery, receipt, organization, adjudication, uptake, or repair is disabled because it carries relevant opposition or correction.
Un-reality	Supported only when an identified authorized representation retains consequential reality-status through the disabled correction. Censorship can precede that successful installation.
Un-reason	Requires further reason-shaped immunization: concepts, burdens, exceptions, or causal accounts convert the correction into confirmation, contamination, danger, disinformation, or evidence that more suppression is needed. Naked silencing does not satisfy this mechanism.
Organized un-reality	Supported when human, linguistic, symbolic, incentive, record, platform, legal, and institutional channels recurrently preserve the protected representation together.
Systemic lying	Requires the larger constitutional meta-order recurrently to generate, select, authorize, protect, and replace organized un-reality. One censorial episode or local cover-up is insufficient.

The strict Ideology gate and *Schutzbalken* application belongs to *Culture Program Ecology*. This generic constitutional section supplies the fault relation; it does not turn censorship into an additional constitutional orientation or make every speech restriction a systemic diagnosis.

12. Epistemic stewardship and responsible amplification

The individual-level virtue corresponding to public contestability is **epistemic stewardship**, with **responsible amplification** as its everyday practice. Both expressions are proposed terms in this synthesis.

> **Epistemic stewardship is the disposition to treat one's power to transmit claims and allocate other people's attention as a responsibility.**

Its operational rule is:

> **Verify, qualify, or withhold.**

Before forwarding a consequential claim, a person performs the simplest competent check proportionate to its reach and possible harm. This can include reading beyond a headline, identifying the original proposition, checking the date and context, following the source chain, reproducing an elementary calculation, looking briefly for serious counterevidence, and distinguishing observation, inference, prediction, opinion, and satire.

Nobody can verify everything. *Qualify* therefore matters. A person may say, "I have not verified this; I am sharing it as a question that deserves examination." The constitutional failure occurs when uncertainty is silently converted into assertion and transferred to others as if someone upstream had checked it.

Source evaluation must also separate rhetorical form from evidentiary content. Institutional actors can usually purchase legal review, press offices, editorial polish, repetition, and the appearance of calm, while counter-power may be carried by people who have borne years of financial, occupational, reputational, or associational cost. Polished civility is therefore not an independent truth signal, and anger, satire, cynicism, colloquial language, or polemic is not an independent falsity signal. Nor does costly or impassioned dissent prove the claim. Extract the

proposition, evidence, uncertainty, source position, mechanism hypothesis, moral judgment, and rhetorical vehicle, then evaluate each at its own level.

Attention to tone becomes correction impairment when the proposition is evaded, the corrector's wound or sharpness is used to discredit the witness, and the underlying evidence thereby escapes reception. Legitimate criticism of exaggeration, unsupported accusation, or abusive conduct remains available; the test is whether form is being used to answer the proposition or to avoid it. The communicative operation is typed as **LT-046 — Civility shield** when polished delivery receives an evidentiary bonus, sharp delivery receives an evidentiary penalty, and the resulting style judgment displaces examination of the proposition.

Forwarding is not merely self-expression:

> **To amplify a claim is to vote for what the collective mind will attend to.**

The reality-anchored cultural mapping is:

```
checking before amplification → responsibility
checking one's own side       → integrity
marking uncertainty           → honesty
refraining from noise         → attentional restraint
correcting one's own claim    → honour
careless repeated forwarding  → unreliability
```

This should remain a virtue and shared yardstick rather than an official score, badge, or permission system. An agency-supporting mechanical-solidarity field can make stewardship honourable through local bigOthers; it must not convert the norm into an epistemic police force or grant one institution custody of reality.

Claim resolution and localized uncertainty Epistemic stewardship also requires uncertainty to remain attached to the proposition and resolution at which it arises. The governing rule is:

> **Uncertainty should qualify the proposition and resolution to which it applies; it should not automatically invalidate conclusions independently supported at another resolution.**

A historical, scientific, administrative, or forensic inquiry can contain several separable claim levels:

Claim level	Typical question
Existence	Did the event, pattern, mechanism, or harm occur at all?
Direction and mechanism	Which processes contributed, and in which direction?
Magnitude or range	What scale is supported, and within what bounds?
Exact reconstruction	Which precise sequence, allocation, count, or parameter value occurred?
Attribution	Which actors, institutions, doctrines, or conditions contributed, and how much?
Authorization and remedy	What action, if any, follows under the relevant rights, jurisdiction, and burden of proof?

Evidence does not move automatically up or down this ladder. Strong evidence that a phenomenon occurred does not validate one exact total, complete mechanism, or actor attribution. Uncertainty about the exact total or initiating path likewise does not erase a phenomenon, lower bound, direction, or causal contribution established by other evidence. Every claim should disclose which level is supported, bounded, disputed, or unknown.

Norm, practice, prevalence, and enforcement are likewise different objects. An authoritative text or rule can establish what a programme permits, requires, or forbids without establishing how often carriers complied, how institutions enforced it, or which rival motives shaped conduct. Observed practice can establish implementation without exhausting doctrinal meaning. Multiple causal contributions can coexist: evidence for an economic, strategic, religious, familial, or status mechanism does not by itself replace the others. Exclusive attribution requires evidence for exclusivity rather than preference for one explanatory vocabulary.

Modelling is legitimate evidence-bearing work when direct measurement or controlled experiment is unavailable, provided its inputs, assumptions, dependency structure, identification limits, uncertainty, and sensitivity are inspectable. Ranges, lower and upper bounds, partial identification, scenario comparison, and robustness across plausible assumptions can support a coarser conclusion without pretending to deliver an exact reconstruction. A

model remains a model rather than a measurement; that distinction prevents both model-to-reality laundering and dismissal of every model-mediated inference as fictitious.

Incomplete evidence can also converge across different routes. Records, material traces, observed consequences, and constrained reconstructions may jointly discriminate between explanations even when none supplies a complete event history. Inspect whether those routes provide additional information or merely repeat one source, assumption, or selected sample. Neither evidential accumulation nor residual uncertainty settles that question without examining the dependencies.

Negative evidence must be matched to its **opportunity for detection**. A later inspection after repair, replacement, dispersal, or other change tests a different state from the one that produced an earlier event. Failure to find a trace weighs against the historical claim insofar as that trace should still have been present and detectable under the actual sampling conditions. This preserves informative negative findings without treating every later absence as proof that the earlier condition never existed.

Quantitative comparison likewise requires a declared measurement basis: unit, population, geography, interval, event definition, exposure denominator, and rules for repeat counting and overlap. Match those dimensions or explain and account for their differences before drawing a like-for-like conclusion. Distinguish a stock at one time, a flow over an interval, a cumulative total, a count of distinct affected persons, and a counterfactual shortfall. A cumulative count can exceed a contemporaneous stock as membership changes over time; that arithmetic possibility neither refutes nor verifies the count. Compare estimates symmetrically as reconstructions constrained by evidence: the preferred estimate does not become a measurement merely because its rival is visibly modelled.

The practical method is:

```
state the exact proposition under examination
→ identify the resolution at which the evidence operates
→ separate observed, reconstructed, modelled, and inferred components
→ report ranges, lower bounds, sensitivity, overlap, and unresolved allocation
→ preserve supported coarser conclusions
→ withhold unsupported finer conclusions
→ let new evidence revise the appropriate level
```

This rule also controls source labels. Calling an author, estimate, or reconstruction *controversial* identifies a dispute or source-position fact; it does not answer the proposition. Counter-power status can justify searching for neglected evidence but does not confer truth. Evaluate claims, methods, assumptions, records, and rivals at their own level.

The corresponding communicative failure is **LT-049 – Precision veto**: a speaker demands finer specification than the operative claim requires and uses its absence to cancel the supported claim wholesale. The boundary runs both ways. A legitimate request for precision remains necessary where the decision, attribution, sanction, or claimed number depends upon it; proposition-local uncertainty is not permission to round every contested detail toward a preferred story.

Science, prophecy, and synthesis authority Max Weber's distinction between empirical scholarship and value judgment and Ernst Troeltsch's attempt at a historically responsible present synthesis expose a permanent constitutional tension. Knowledge can clarify facts, causal relations, likely consequences, internal consistency, and conflicts among values. No scholarly title silently supplies authority to resolve every value conflict, select one civilizational future, or convert a historically situated synthesis into the voice of science itself.

Christopher Dawson supplies a related precursor warning about a **discipline-to-creed transition**. An empirical field can begin to supply a total history, moral diagnosis, programme of reform, future destination, and sacred authority while continuing to draw upon the prestige of science. Interdisciplinary synthesis, moral concern, or policy advice is not such a transition by itself. The audit asks where empirical inference ends, who authors the values and future horizon, which jurisdiction the synthesis claims, and whether contrary evidence can reduce both the proposition and the authority attached to it.

A scholar, intellectual, religious carrier, or public institution may openly propose such a synthesis. The constitutional requirement is to mark the transition from description and causal inference into authorship, selection, valuation, and political authorization. The synthesis must remain attributable, inspectable, revisable, and open to successor participation. Conversely, value conflict does not require paralysis or forbid scholarship from examining consequences. The boundary prevents empirical office from laundering prophecy, and prevents the fear of prophecy from disabling responsible public judgment.

Policy necessity without fabricated facts. Suppose a study supports the claim that intervention A can reduce a specified harm under stated conditions. It does not follow that A must be adopted: that conclusion additionally selects the weight of the harm, acceptable costs, affected rights, relevant alternatives, and an authorized decision procedure. The inference can fail even when the measurements are sound. Audit the handoff from empirical support to value selection and binding choice, including which alternatives were excluded before the comparison began. Declared, corrigible normative scholarship remains distinct from an empirical claim and from programme-bound inquiry that protects its destination against correction.

Immediate duty and system-policy inference. A valid and urgent duty toward a concrete person does not by itself establish the system-scale causal account, exclusive remedy, or public authorization later attached to it. Keep the inference levels visible:

```
supported immediate duty in a specified encounter
!= forecast of the aggregate effects of one recurring institutional response
!= proof that this response is the best or only policy serving the duty
!= authority to bind every affected person and jurisdiction to the package
```

Moral certainty can legitimately govern the first relation while the later relations remain empirically and politically unsettled. Audit the unit, scale, period, incentive and displacement effects, externalized costs, alternative ways to honour the same duty, affected rights, jurisdiction, authorization, correction, and stopping condition at each handoff. Conversely, uncertainty or disagreement about the system policy does not cancel an independently established immediate duty. This is a policy-inference boundary, not evidence that compassion is insincere, that the system effect is harmful, or that an advocate is using the case as a pretext. Where a personal or small-group care grammar is itself transferred into an extended coercive order, add the distinct moral-scale-transposition audit.

The policy-production circuit can amplify the apparent warrant through several organizations without adding independent evidence. Count evidential origins, methods, and correction routes, not merely institutional names: a study, reports of that study, expert advice based on it, and a consultation citing that advice are not four replications. Shared funding or personnel calls for a dependency audit, not automatic rejection of the result. Conversely, formally separate organizations do not establish independence where selection and correction return to the same custodian. The constitutional test is whether adverse findings and affected-person challenge can change both the proposal and the authority, resources, or jurisdiction claimed for it.

13. Low-cost contradiction, not low-cost condemnation

Protecting truthful disclosure does not justify converting anonymous reporting into a system of denunciation. A reality-anchored constitution distinguishes:

- **contradicting a claim, model, record, policy, or prediction**, which should be inexpensive and widely accessible; from
- **accusing a person in a process capable of imposing serious reputational, professional, legal, or social consequences**, which must be precise, evidentially grounded, and procedurally constrained.

The compact rule is:

> **Make contradiction cheap; make evidence preservable; make accusations precise; make investigation independent; make sanctions procedurally demanding; make institutional error repairable.**

This is the constitutional answer to the moralization mechanism developed in *Culture Mechanics*. Drawing on Michael Andrick, that account shows how an exchange can move simultaneously from the issue to the person's character and from inquiry to accusation, so that a statement, omission, association, missing conformity signal, imposed marker, or attributed target label becomes an alleged disclosure of an unbearable person. The present section does not reproduce that mini-theory; it specifies the institutional barrier against turning such a character accusation directly into lost civic standing or punishment.

An anonymous discrepancy report may legitimately trigger evidence preservation, an audit, or investigation. It must not itself count as evidence of guilt. Person-directed proceedings require, in proportion to their consequences:

- specification of the alleged act and applicable rule;
- preservation and disclosure of the substance of the evidence;
- an opportunity to answer and present contrary evidence;
- separation of reporting, investigation, adjudication, and sanction;
- an explicit standard of proof and reasoned decision;
- proportionality, independent appeal, correction, and repair after error.

Due process is not only mercy toward an accused person. It is an error-correction technology. The EU Whistleblower Directive, for example, couples reporter protection with protections for the implicated person's identity, presumption of innocence, right to be heard, access to the file, and effective remedy. The epistemic-constitutional principle is broader than that particular legal instrument.

The same separation applies when a Culture Program is suspected of producing a system-level hazard. Under the **Self-Attribution Presumption** and **Self-Description Valence Asymmetry**, an authenticated, serious adverse self-attribution receives first-pass credence as evidence of the actor's own operative allegiance or perceived authorization; favourable self-description does not exculpate the program from its operation or consequences. One credible high-severity proclamation may justify preservation of records, mapping of finance and authority, or an audit of the **Culture Program carrying structure** without establishing any other human carrier's guilt or proving parent-program causation. The corresponding **Attribution-Source Asymmetry** prevents a hostile third party from manufacturing the same warning merely by assigning "Nazi," "terrorist," "cult," or "Cultural WMD" to an opponent. Such a label establishes an allegation and reveals part of the accuser's classification or attack grammar; it does not establish the target's program or hazard class. An unsupported accusation may justify preserving and examining the claim, not treating the accused as if they had self-attributed it. Projection likewise requires independent evidence and cannot be inferred from falsity alone. Measures against an organization, school, money flow, communications route, or other infrastructural node still burden persons and associations. They therefore require a specified functional nexus, legal authority, proportionality, notice, answer, independent review, and repair after error rather than functioning as indirect person-directed punishment. The presumption, source asymmetry, and carrying-structure definition and intervention ladder belong to *Culture Program Ecology*.

A systemic-lying constitution tends to reverse the proper cost structure:

```
contradicting an authorized proposition → expensive
accusing a designated opponent          → cheap
```

A reality-anchored constitution reverses that reversal:

```
challenging claims                       → easy
condemning persons without tested proof  → difficult
```

14. Memory, provenance, and correction

Collective memory is part of the epistemic constitution because present judgment depends upon the evidence, alternatives, predictions, failures, and earlier dissent that the public record preserves.

A reality-anchored order records:

- original sources and source chains;
- the evidence and uncertainty available when decisions were made;
- who exercised which authority and within what jurisdiction;
- reasons, predictions, and expected consequences;
- objections and minority analyses;
- subsequent outcomes, failed replications, corrections, and reversals.

A systemic-lying order instead edits memory so that the authorized account appears always to have been obvious, unanimous, successful, and morally uncontested. Past predictions disappear; failures are renamed; dissenters become invisible or retroactively illegitimate; and later generations inherit no vocabulary or evidence with which to reconstruct the excluded alternative.

Correction therefore has both present and historical forms. Retraction without preserved provenance can become another memory hole. A healthy constitution makes correction visible while retaining enough of the error history for later institutional learning.

Foundational-question custody An order does not preserve hard-won knowledge by transmitting conclusions alone. **Foundational-question custody** preserves the question that generated a conclusion, the experience that made it urgent, the serious rival answers, the causal record, the errors and harms through which alternatives were defeated, and the conditions under which new evidence should reopen the settlement.

```
conclusion without originating question
→ inherited formula
→ forgotten alternatives and failure mechanisms
```

```
→ later disagreement appears unprecedented
→ defeated programme can return without its causal record

question + evidence + rivals + consequences + reopening conditions
→ living foundational knowledge
```

This is not a demand to keep every settled issue permanently undecided. Division of cognitive labour requires compression, curricula, and provisional closure. The custody duty rises with the severity, recurrence, irreversibility, and constitutional reach of the discarded alternative. The archive must preserve enough detail to distinguish a refuted mechanism from a changed condition, a real innovation from renamed repetition, and a causal offspring from an unrelated event.

Foundational-question custody therefore preserves more than information for state transmission. It must retain enough examples, contrasts, rival accounts, causal sequences, practices, and correction records for later recipients to reconstruct the relevant codebook and perform the discriminating operations again. An inherited conclusion can remain compact, but the order must not destroy the operation path by which a new generation can decompress, apply, and challenge it.

The history of socialist and communist programmes is a central application. Famine, terror, pseudoscience, coercive collectivization, censorship, and blocked correction should not be stored as external accidents merely because exact death totals, multi-actor conflicts, regional causes, and counterfactual decomposition remain disputed. Programme attribution remains warranted to the degree that doctrine, institutions, incentives, policy, force, or protected representations created, amplified, prolonged, scaled, or prevented correction of the harm. Quantitative allocation and double-counting remain separate evidential tasks. Lysenkoism and programme-driven famine are especially important because protected social un-reality became materially answerable to biology and agriculture only after the order had disabled questions and sensors that could have corrected it earlier.

The rule is symmetrical. Liberal, nationalist, religious, scientific, market, and administrative orders must preserve the failures and dependencies of their own governing answers rather than treating victory, survival, or present prestige as proof that the foundational question has disappeared.

Constitutional classification orientations and their poles

15. An extensible multi-orientation classification

A **constitutional classification orientation** asks one analytically distinct question of a mythologically and institutionally constituted social order. A **pole** is an ideal-typical limiting configuration within that orientation, not a claim that any whole society perfectly realizes it.

This document currently recognizes two such orientations. The list is deliberately open: later theory development may add further orientations when they pose a genuinely independent question, define their endpoints and evidence, state their unit and scale, and demonstrate that they cannot be reduced to an existing axis. The present orientations must not be aggregated into one moral or mathematical score.

Classification orientation	Governing question	Poles
Truth orientation	How do authorized representations relate to mind-independent reality, evidence, avowal, and correction?	reality-anchored truth-seeking ↔ systemic lying
Drive orientation	What does the shared order organize motivation to reproduce?	life-drive ↔ death-drive

These orientations classify different aspects of one epistemic constitution. The truth orientation concerns its epistemic relation to reality; the drive orientation concerns its mythological and motivational direction. The phrase **mythological epistemic constitution** may emphasize that second aspect, but does not create a separate constitutional genus.

Un-reason does not add a third row. It is a possible cross-scale mechanism by which reasoning helps move a person, programme, institution, or constitution away from independent correction within the truth orientation. Its presence does not settle drive direction, Culture Program branch, subjecthood absorption, jurisdiction, capture, hazard, or intent.

Un-reality does not add a third row either. It names a state or output within the truth orientation: an authorized representation possesses operative reality-status while its independent correction is blocked. It can be local or domain-specific; **organized un-reality** is its stronger multi-channel form; the systemic-lying pole is the constitutional ideal type that recurrently reproduces that state.

The **sacred-principal allocation audit** also remains outside the table. Its governing question may prove independent, but the present candidate lacks adequate opposed endpoints and may be better represented as a typed allocation map than as a third orientation.

Every actual constitution is mixed and may occupy different positions by institution, domain, time, and scale. A laboratory may be highly reality-responsive while its personnel process is denunciatory; a government may preserve due process while manipulating public statistics; a dissident community may protect sincerity while installing a rival, closed authority. These variations are reasons for multi-orientation analysis, not objections to the poles.

15.1 Truth orientation: reality-anchored truth-seeking ↔ systemic lying The **truth orientation** asks whether social authorization preserves independent routes by which reality can defeat an account, or makes authorized representation determine what may count as reality. Its poles specify a genuine directional opposition. On each relevant dimension, stronger independent correction weakens the corresponding mechanism of systemic lying, while stronger authority-gating, compelled performance, memory control, or semantic manipulation weakens collective corrigibility.

Dimension	Reality-anchored, truth-seeking pole	Systemic-lying pole
Ontological premise	Mind-independent reality can resist every account	Authorized representation determines socially admissible reality
Operative reality-status	A representation's authority and use can fall when observation, prediction, consequence, or rival explanation defeats it	An un-real representation retains practical reality-status because authorization controls how correction may count; organized un-reality can persist after contradiction becomes publicly visible
Epistemic aim	Active truth-seeking and improving truth-tracking	Operative effectiveness, loyalty, control, or preservation of the system
Public avowal	Belief, doubt, uncertainty, and revision may be sincerely expressed	Performative conformity is safer than honest expression
Authority	Universal corrigible meta-jurisdiction with plural, transparent, defeasible, and bounded representatives	Representatives monopolize the meta-order, become self-certifying or preemptive, and spill beyond allocated jurisdiction
Evidence	Content and provenance remain independently inspectable	Authorization controls admissibility and weight before examination
Disagreement	A social sensor and legitimate route to correction	A sign of ignorance, contamination, disloyalty, or danger
Discussion	Opposing propositions receive a visible and equal stage	Deplatforming, weak opponent selection, ritual consultation, or authorized verdict
Correction	Mind-changing, retraction, and concession can be honourable	Correction threatens status; failures are denied, renamed, or forgotten
Public telemetry	Visible speech approximately represents distributed judgment	Preference and knowledge falsification manufacture apparent consensus
Language	Meanings and burdens remain explicit and contestable	Linguistic tricks, euphemism, semantic drift, and sophistry steer interpretation

Dimension	Reality-anchored, truth-seeking pole	Systemic-lying pole
Use of reason	Premises, standards, exceptions, and conclusions remain reciprocally testable and independently corrigible	Reasoning can be recruited into un-reason: protected conclusions control the concepts, burdens, exceptions, and permitted defeat conditions
Attention	Responsible amplification and prioritization of consequential disagreement	Flooding, outrage competition, repetition, and noise exhaust checking capacity
Memory	Provenance, predictions, dissent, and correction histories are preserved	Records are selectively erased, rewritten, or detached from context
Person-directed accusation	Precise allegations, tested evidence, due process, appeal, and repair	Cheap denunciation, vague charges, asymmetric secrecy, and irreversible stigma
Program or hazard attribution	Self-description and independent doctrine, conduct, organization, and offspring evidence are source-separated	Hostile labels and nuclear taboo vocabulary bootstrap target classification
Institutional structure	Independent causal routes reduce common-mode failure	Synchronization makes nominally separate bodies reproduce one protected account
Membership	Persons retain dignity while claims remain conditional	Belonging, virtue, and factual assent become fused
Everyday participation	Members check, qualify, dissent, and correct	Members forward, conceal, perform, sanction, and normalize the authorized account

Sections 16–19 define the truth-orientation endpoints and movement between them in detail.

15.2 Drive orientation: life-drive ↔ death-drive life-drive–death-drive constitutional orientation *noun phrase*
Status: proposed canonical Culture Mechanics classifier; no scalar measure is adopted

The canonical name preserves the originating user's naming choice after review of the competing positive-good, flourishing, adversary-dependent, and antagonism vocabularies.

The **life-drive–death-drive constitutional orientation** asks what the shared order organizes motivation to reproduce. It applies at constitutional scale the Lacanian drive vocabulary operationalized for mythologies in *Mythology Construction*.

The two poles are:

> **Life-drive pole:** The shared order directs motivation through limits, reality-facing practice, and finite projects toward building, binding, repair, capability, relationship, maintenance, reproduction, transmission, and posterity. Completion is allowed to count as completion.
>
> **Death-drive pole:** The shared order directs motivation into self-renewing circuits of repetition, negation, grievance, transgression, destabilization, or adversarial conflict. Resolution threatens the circuit's organizing function, repetition becomes a destination, and the programme progressively consumes its human, relational, institutional, or intergenerational carriers.

Lacan does not posit two independently operating psychological substances, and the poles do not mean biological life versus a conscious wish to die. Life-drive and death-drive are entangled aspects of drive. Culture Mechanics turns them into ideal-typical constitutional orientations by asking whether a shared mythology, its scripts, and its institutions predominantly bind drive into life-supporting forms or into excessive repetition that persists beyond and against its stated purpose. The primary psychological definitions remain in the death-drive section and the life-drive section of *Mythology Construction*.

For readers unfamiliar with Lacanian vocabulary, the poles have useful plain-language approximations:

Term	What it emphasizes
Life-drive	The motivational and repetitive dynamic that builds and binds life-supporting forms
Generative orientation	Accumulation of capability, relationship, creation, repair, and future possibility
Positive-good orientation	Goods valued independently of defeating an opponent
World-building orientation	Creation and maintenance of an inhabitable common world
Flourishing-directed orientation	A hoped-for substantive outcome
Death-drive	Repetition persisting beyond and against its original purpose
Self-reproducing negation	Opposition becoming the programme's renewable activity
Adversary-dependent orientation	Identity and motivation requiring a constitutive opponent
Renewable conflict	Resolution generating a successor conflict rather than terminating the circuit
Permanent activated antagonism	The observable social state of continuously activated conflict
Self-consuming repetition	The circuit progressively destroying its carriers and conditions of continuation

These are near-synonyms, not interchangeable definitions. Life-drive and death-drive name motivational and repetitive dynamics; positive goods and flourishing name telos and outcome; adversary dependence names an identity mechanism; permanent activated antagonism names a possible system state; antagonistic over-coupling names an interaction mechanism; and a conflict-level agent would be a possible emergent result. **Ragnarök trajectory** names a possible temporal system path in which successful reproduction advances terminal rupture and possible self-extinction.

The two characteristic circuits can be compressed as:

```
LIFE-DRIVE ORIENTATION

open desire
→ chosen limits and encounter with reality
→ finite, answerable, and completable projects
→ capability, relationship, creation, repair, and maintenance
→ genuine completion
→ transmission and renewed possibility

DEATH-DRIVE ORIENTATION

open desire
→ constitutive norm, negation, or adversary
→ renewable demand, refusal, or conflict
→ resolution threatens identity or the circuit's reward
→ closure is reclassified as accommodation, compromise, or betrayal
→ renewed repetition
→ progressive consumption of carriers
```

The most complete compound compression of the two poles is:

> **The life-drive pole joins open desire, ethical responsibility, deferred gratification, reality-corrected effort, sublimation, responsible interdependence, democratic accountability, cultivation, maintenance, and succession into accountable generativity.**
>
> **The death-drive pole joins captured desire, impossible demand, perverse instrumentality, exculpation through the big Other, instant symbolic reward, interpassivity, surrogate dependency, unaccountable power, renewable negation, and substrate consumption into an anti-future circuit of exculpated self-consumption.**

This is an endpoint compression rather than a list of individually necessary or sufficient conditions. It gathers psychological gradient, relation to the big Other, temporal discipline, sublimation, dependency, accountability, cultural production, and system trajectory without collapsing them into one scalar measure. A psychologically uphill act can serve a destructive end; assistance or reduced effort can restore life-serving agency; disciplined sublimation can produce destructive capability; and democracy, accountability, truthfulness, and drive valence remain distinguishable even where the ideal-typical poles align them.

The **affective-return-to-uphill-development mechanism** describes how a person or cultural field might move away from one downhill attractor through future horizon, authorship, alternative reward, capability, relationship, correction, and an affirmative successor mythology. It is a transition mechanism within this orientation, not a third orientation, a scalar score, or evidence that every case can or should be moved by the same affective route.

The **ethical responsibility–perverse instrumentality** contrast follows **Slavoj Žižek's** explicit opposition in *How to Read Lacan*: the perverse political position presents itself as the exculpated instrument of the big Other's directly knowable Will, whereas Sophia Karpai's refusal to make medical truth serve Stalinist necessity is presented as the opposite, a Lacanian ethical act. The broader coupling of that contrast to accountable generativity, democratic accountability, surrogate-dependency hazards, and the drive orientation is a Culture Mechanics synthesis. **Perverse instrumentality** names a specified relation among act, authorization, claimed necessity, enjoyment, and displaced responsibility; it is not a sexual description, clinical diagnosis, population type, or inference licensed by obedience or harmful effect alone.

Žižek also supplies a narrower source bridge from this structure to **fundamentalism** and to a possible mechanism of extreme discharge. In his analysis of Mohammad Bouyeri's letter to Ayaan Hirsi Ali, willingness to die for truth is transformed into wishing death as proof of truthfulness, while death is made the final separator of Truth from Lies. Žižek describes the perverse move as displacing division onto the Other: the opponent is declared inconsistent, whereas the actor escapes their own division by assuming the supposedly unambiguous position and demand of the big Other. He then defines perversion formally as claiming direct access to a figure such as God, History, or another bearer of ultimate authorization and acting as the instrument of its will. His deliberately symmetrical political examples are Osama bin Laden and President George W. Bush insofar as each presents action as directly ordered and guided by divine will. His further compression is that the fundamentalist "does not believe, he knows it directly."

This gives a candidate pathway:

```
claimed direct knowledge of the big Other's Will
→ ambiguity, mediation, and subjective division are denied or displaced
→ the actor presents the act as execution rather than an answerable choice
→ sacrifice or death can become a proof of truth, fidelity, or authorization
→ extreme or violent discharge becomes possible
```

The final connection to **fanatic offspring** is a Culture Mechanics diagnostic synthesis rather than Žižek's terminology. Žižek's nearby source term is *fundamentalist*, not the project's defined *fanatic*. *Culture Program Ecology* therefore keeps four levels separate: perverse instrumentality as a candidate subject–authorization mechanism, fundamentalist form as a sovereign-Will person–programme relation, coercive or eliminative enforcement as an outward operation, and fanatic offspring as an observable extreme discharge. No one of them entails another without further evidence.

Tragic protective responsibility A different structure appears when a person judges that force or another normally wrongful act is necessary to protect others from serious and imminent harm, yet does not treat necessity, office, or collective authorization as moral purification. **Tragic protective responsibility** names this burdened position. It is neither a general permission for violence nor a claim that harmful means become good when their end is described as protective.

The minimum audit asks for separately inspectable support for:

- an actual threat and persons exposed to it;
- necessity after serious consideration of feasible less harmful alternatives;
- proportionality between the threatened harm and the proposed response;
- lawful authority where available, due process where possible, and protection against private vengeance;
- review, stopping conditions, correction, and repair; and
- the actor's continuing ownership of judgment, error, consequence, and guilt.

Refusal to use force can itself abandon persons to an aggressor, so clean hands cannot be made the only good. Yet accepting dirty hands does not create innocence:

Someone may have to accept dirty hands, but the dirt must remain visible.

The contrast with perverse instrumentality concerns authorship. The tragic protector says, in effect, "I judged, acted, may have been wrong, and remain answerable to the persons harmed and protected." The perverse instrument says, "The Other, History, law, necessity, or the programme acted through me; obedience proves my purity." The first can still be mistaken, disproportionate, captured, or criminal; its self-description supplies no exemption from evidence and review.

Responsibility also follows the decision and causal chain. A community that authorizes, directs, or benefits from a harmful protective act cannot preserve its own purity by assigning all moral burden to an executor. That **moral-outsourcing** configuration would turn a purported protector into a designated carrier of costs that the authorizing We refuses to own.

Specific theological, religious, and historical applications do not follow from this generic constitutional distinction. The following application makes its source and interpretive limits explicit.

Ilyin and the biblical tragic-protector synthesis

Ivan Ilyin's 1925 *On Resistance to Evil by Force* supplies the historical-philosophical application behind the project term. Written against Tolstoyan nonresistance after revolution, civil war, and exile, its relevant position is not that violence becomes good when directed against evil. It is that refusal can abandon another person to aggression, while force judged necessary for protection can remain an injurious and spiritually dangerous act whose agent must own the burden.

The project's Ilyin compression is:

The defender may be right to act without becoming righteous through the act.

A person may choose nonresistance and suffering for themself. They cannot automatically choose another person's abandonment merely to preserve their own clean hands. Yet the word *protection* cannot authenticate the use of force. The threat, exposed persons, feasible alternatives, proportionality, authority, stopping condition, and continued standing of the opponent remain independently reviewable. The actor's willingness to bear guilt is not proof that the judgment was correct.

The development's **Sündenesser** comparison distinguishes four structures:

Figure	Burden relation
Ritual sin-eater	Symbolically receives sins attributed to acts already committed by others.
Scapegoat	Receives projected or transferred guilt so that another person or group appears clean.
Tragic protector	Owns the morally injurious act that they judged necessary to protect another and remains answerable for error and consequence.
Perverse instrument	Treats authorization by God, History, office, or programme as purification: the act is represented as the Other's necessity rather than the agent's answerable choice.

Within the Christian interpretation used here, atonement belongs to none of these responsibility transfers. God bearing human sin and suffering is not the same structure as an agent committing evil against another person "on their behalf" and calling that act atonement.

The tragic protector is therefore not made innocent by becoming a designated "sin-eater" for the community. If a community authorizes, directs, and benefits from force while placing the entire stain on the executor, it performs moral outsourcing. Responsibility must follow the decision and causal chain. Ilyin's warrior–monk relation is useful here insofar as conscience and spiritual accompaniment keep force from becoming self-sanctifying; it becomes dangerous if the companion certifies supposed divine enemies or guarantees the warrior's purity.

The project constructs a related biblical protector motif set:

Motif	Possible authorization	Internal limit
Rescue those led to death (Proverbs 24:11–12; Psalm 82:3–4)	Passivity can abandon the vulnerable.	The obligation does not itself specify violence.
Accountable watchman (Ezekiel 33:6–9)	Omission can incur responsibility for preventable harm.	The immediate duty in the passage is warning, not unlimited coercion.
Shepherd and wolf (John 10:11–13)	Protection may require facing danger.	The shepherd first gives his own life rather than feeding a victim to the flock.
Sword-bearing servant (Romans 12–13)	Public authority may restrain wrongdoers.	The passage follows the rejection of private vengeance; office does not confer moral infallibility.
Soldiers under commandment (Luke 3:14)	Soldiering is addressed without a demand for immediate desertion.	Soldiers remain bound against extortion and false accusation.
David and the Temple (1 Chronicles 22:8–10)	A blood-stained ruler can remain chosen and historically consequential.	Bloodshed does not qualify David to build the Temple; peace must complete what force cannot build.
Peter's interrupted sword (Luke 22:49–51; Matthew 26:50–54)	Protective zeal is intelligible in the face of arrest.	Jesus stops the blow and restores the injured enemy; zeal does not authenticate its own means.

The Davidic sequence matters because Christian scripture presents Jesus in David's lineage. David prepares but does not build the Temple because of his bloodshed; Solomon, whose name and reign are associated with peace, builds it; the later Son of David refuses armed rescue, identifies his body with the Temple, and undergoes violence rather than establishing his kingdom through his followers' swords. The arc allows force to remain historically consequential without making it the builder of the sacred order.

Enemy-love, non-retaliation, the command to put away the sword, and the non-fighting character of Jesus's kingdom remain substantial countertexts. The biblical table is therefore a contested Christian synthesis supporting a narrow tragic-protector possibility, not an uncontested proof of Ilyin's entire doctrine or a general licence for sacred war. It preserves the decisive constitutional distinction:

```
tragic protection
→ the threat is concrete and externally reviewable
→ the opponent remains a person
→ necessity narrows action and supplies a stopping condition
→ the agent and authorizing community remain answerable

sacralized violence
→ the programme identifies an enemy of God, History, or salvation
→ authorization purifies the act
→ resistance proves guilt
→ expansion or destruction can renew the sacred programme
```

A **constitutive adversary** is an opponent whose continued existence performs load-bearing identity and motivational work for a programme, so that eliminating the stated problem would threaten the programme's own coherence. Adversary dependence is a common death-drive mechanism, not the whole definition: a repetitive circuit can also become self-renewing through grievance, transgression, accusation, failure, or anti-telic refusal without depending upon one concrete enemy.

Ressentiment conversion is one candidate pathway into adversary dependence and death-drive renewal, not a third constitutional orientation and not their universal origin. On that route, another person's flourishing is reclassified from an exemplar of possible good into evidence or the supposed cause of wrongful exclusion; diminishing the other's good then begins to substitute for constructing an independently valuable good, and mythology can make the negative operation socially authorized and renewable. The constitutional classification is reached only if the shared order comes to organize motivation through the resulting self-renewing circuit. Painful comparison, envy, grievance, ressentiment, negative goal substitution, adversary dependence, and death-drive repetition therefore remain distinct stages, and other routes into the death-drive pole remain possible.

The originating observation remains:

A common semantic world does not by itself produce motivational alignment, and a shared order can be destroyed through antagonistic over-coupling rather than through Babelization.

Opposing groups can remain mutually intelligible and intensely responsive while organizing themselves around incompatible purposes. Reciprocal observation, internal synchronization, threat confirmation, and suppression of internal counter-signals may produce **antagonistic over-coupling**: each camp increasingly acts in response to the other until the conflict system, rather than either side's original positive purpose, organizes the interaction. The resulting hypothesis is that antagonism may acquire emergent agency and increasingly operate both camps. **Conflict-being** remains a candidate name for such a result rather than an established construct.

Permanent contestability must therefore remain distinct from permanent activated antagonism. A life-drive constitution can maintain viable dissent, opposition, appeal, correction, and succession scripts without continuously manufacturing an enemy. Conflict, criticism, rivalry, bounded agonism, and defensive struggle are not death-driven merely because they are forceful. They can protect persons, expose error, correct domination, or defend a habitable order. The death-drive classification begins where opposition becomes self-reproducing, lacks a credible stopping condition, displaces the goods it originally served, or cumulatively destroys the containing order.

Independence from the truth orientation The drive orientation and truth orientation can interact but must not be collapsed:

	Life-drive pole	Death-drive pole
Reality-anchored	Truthful, corrigible pursuit of constructive goods	Accurate observation employed in a self-renewing or escalating destructive circuit
Systemic lying	Claimed flourishing protected through falsehood and closed correction	Renewable negation or enemy construction combined with insulation from reality

A conflict system may make factually accurate observations about an opponent while organizing those truths toward destructive escalation. A systemic-lying order may invoke peace, stability, life, or flourishing while disabling correction. Truthfulness does not by itself specify a life-serving purpose, and a professed life-serving purpose does not establish truthfulness.

The drive orientation is likewise independent of order level, full slot occupancy, jurisdiction, corrigibility, cultural interoperability, subjecthood absorption, synchrony, and *Beseelung*. None of those axes establishes whether motivation is being bound into completable goods or self-consuming repetition.

Pageau's Grail question provides a compact service-direction probe for this independence. A constitution can generate abundance, technological power, disciplined institutions, or impressive capability without thereby reaching the life-drive pole. The further questions are which persons and forms of life the capability protects or makes dependent, which operative objective selects its use, what it sacrifices, whether persons remain principals rather than instruments, and what trajectory it strengthens over time. This is why life-drive classification asks what the resulting power serves, not merely whether power was successfully produced.

The Edelmanian queer pole as the closest real-world doctrinal limit case In this section, **queer does not name a sexual orientation**. David Halperin's *Saint Foucault* distinguishes gay identity, which can have stable positive content, from queer as a relational positionality defined through opposition to what is normal, legitimate, or dominant. Sexual politics is the historical field in which this formulation arose, but the operative structure examined here is anti-normative and relational rather than an account of whom a person desires.

Lee Edelman's *No Future: Queer Theory and the Death Drive* articulates an especially explicit doctrinal limit case within that anti-normative terrain. Edelman links queer efficacy to refusal of the social and political order, rejection of accommodation and reproductive futurism, negativity, jouissance, and the Lacanian death drive. This is not a death-drive label imposed only from outside; death drive is the book's declared theoretical vocabulary.

At the mythology level, the framework therefore records the originating user's strong but bounded judgment:

Among explicit modern theoretical programmes examined so far, Edelmanian queer negativity is the closest source-attested real-world doctrinal articulation of the death-drive pole.

This limit-case judgment does not establish a direct historical line from Marx, the Frankfurt School, or Laclau and Mouffe to Edelman. The more immediate source field runs through Lacanian psychoanalysis, deconstruction, and the antisocial strand of queer theory; an event description centred on Edelman explicitly places his work in conversation with Lacan, Derrida, and Adorno, but does not by itself prove a complete genealogy. The critique–construction-asymmetry hypothesis supplies only a candidate deeper enabling pathway: a tradition may develop increasingly autonomous negative operations, and one later programme may make refusal of positive settlement explicit. That comparison is neither a claim of direct influence nor evidence that the earlier traditions logically entail Edelman's position.

The correspondence is unusually close:

Life-drive pole	Edelmanian queer pole
Building and inhabiting a world	Refusal of the social and political order
Binding and sustaining relationships	Embrace of antisocial negativity
Repair and maintenance	Refusal of stable accommodation
Positive but corrigible identity	Resistance to positive identity
Finite projects that may genuinely finish	No positive settlement as destination
Reproduction and transmission	Refusal of reproductive futurism
Posterity	*No Future*
The child as concrete successor	**The Child** as the symbolic figure to be refused
Sublimation into capability and creation	Jouissance and death drive
Desire receives successive life-serving forms	Negativity resists conversion into a positive successor form

Edelman's **Child** is not identical with actual children. In the book it is the political-symbolic figure through which innocence, continuity, social reproduction, posterity, and promised redemption by the future are made authoritative. In Culture Mechanics terms, the Child functions as a **master-signifier-like token**, sacred symbolic object, and fantasmatic beneficiary for reproductive futurism. Edelman does not need to have formally named it a master signifier for that functional mapping to be useful.

Object	Culture Mechanics interpretation
Actual children	Concrete persons with standing and needs
The Child	Master-signifier-like token and sacred symbolic object
Reproductive futurism	The larger mythology or Culture Program activated through the token
The future or posterity	Its promised telos and beneficiary horizon
Queerness in Edelman	The negative subject-position constructed as refusing that horizon

The positive **Child at Play** developed elsewhere in this theory is deliberately not a restoration of the same symbolic construction under a positive sign. Its primary referent is the present person's immanent capacity for wonder, risk, play, creation, completion, and beginning again. Concrete children remain persons with direct standing, and succession is downstream of present creation rather than a silent beneficiary whose custodian commands the present. The contrast neither refutes Edelman's critique of reproductive futurism nor licenses compulsory reproduction.

The possible renewal circuit below is a **Culture Mechanics inference**, not a formula attributed to Edelman:

```
existing norm or social order
→ queer refusal and destabilization
→ an alternative relationship or identity becomes established
→ establishment becomes normalization
→ normalization is classified as reproductive futurism
→ renewed refusal and destabilization
```

This case is more radical than ordinary adversary dependence. An adversary-dependent programme says that an opponent still blocks its good. Edelmanian negativity questions the demand for a stable positive future itself. Reproductive futurism supplies the constitutive normative adversary, while refusal of positive settlement supplies

the anti-telic orientation. Negation no longer serves construction or protection of an independently valuable good; negation becomes the programme's renewable identity and activity.

The pure pole need not be a durably stable order. A death-drive programme can realize its logic as a terminal transition: it can use authorship, publication, teaching, recruitment, institutions, and transmission to propagate the very orientation that eventually consumes those carriers and their conditions of continuation. Its disappearance at the endpoint need not show that it failed to instantiate the pole. It may show that the programme completed a self-consuming trajectory.

The boundary is essential. The classification does **not** establish that queer people, homosexuality, all queer theory, every criticism of family or futurity, every rejection of an appeal to children, or every non-reproductive life is death-driven. A childless person can create, maintain, teach, love, repair, and transmit; a pronatalist programme can be oppressive, dishonest, or destructive. The 2015 *differences* issue *Queer Theory without Antinormativity* documents an explicit dispute within queer theory over whether opposition to norms should remain its primary commitment. **Edelmanian queer negativity** names the particular anti-futurist strand examined here, not the field or a population.

Ragnarök trajectory: successful reproduction toward terminal self-consumption **Ragnarök trajectory** *noun phrase*
Status: proposed canonical Culture Mechanics term and controlled mythology-derived trajectory model

A **Ragnarök trajectory** is a death-drive system path in which a Culture Program, constitutional order, conflict system, or distributed field successfully reproduces and strengthens itself by using present capabilities while progressively orienting those capabilities toward a terminal rupture that destroys or discontinues the containing order and may consume the programme's own carriers and conditions of continuation.

Its defining insight is temporal:

> **A death-drive programme can reproduce successfully while reproducing the conditions of its own eventual extinction.**

Short-run reproduction and long-run self-consumption are not contradictory. Reproduction has no fixed drive valence. Writing, teaching, organization, institutional maintenance, and intergenerational transmission are life-drive functions only when they serve the building, maintenance, and renewal of life-supporting forms. The same capabilities can be subordinated to a terminal programme:

```
effective propagation and organization
→ wider installation of a terminal orientation
→ maintenance and transmission become instruments of negation
→ positive settlement and stopping conditions recede
→ human, relational, institutional, or intergenerational substrate is consumed
→ the containing order and possibly the programme itself lose continuity
```

The term currently covers two principal routes:

1. **Antagonistic Ragnarök trajectory:** Rival camps become antagonistically over-coupled; final confrontation increasingly organizes present perception, coalition, preparation, and action until the conflict system drives the containing order toward terminal rupture.
2. **Anti-futurist Ragnarök trajectory:** A programme propagates renewable negation or refusal of positive settlement until the conditions of maintenance, reproduction, transmission, and successor possibility are progressively consumed.

The second route corrects the earlier interpretation of *No Future*. The programme's use of authors, publishers, teachers, readers, and institutions does not create an implementation paradox and does not by itself mean that the carrying structure "borrows life-drive." Those capabilities can be the means by which anti-futurist programming spreads. If the propagated orientation progressively destroys the future-supporting substrate on which it operates, the result is a Ragnarök trajectory. This is a Culture Mechanics inference about a possible programme trajectory, not evidence that Edelman's book or any population has empirically produced that trajectory.

The name is derived from the foretold catastrophic conflict and destruction of the existing divine and worldly order in the *Völuspá* of the *Poetic Edda* and Snorri's *Gylfaginning*. The surviving accounts also include life, gods, and a renewed world after the catastrophe. Culture Mechanics therefore maps the organizing movement toward terminal rupture, not the entire Norse eschatology and not eternal annihilation.

A Ragnarök trajectory is not:

- the definition of the death-drive pole; it is one possible temporal manifestation;

- proof that the whole Norse mythological weave is death-driven;
- every catastrophe, revolution, war, collapse, costly reform, or self-defeating policy;
- a claim that participants consciously desire their own death or know the trajectory's endpoint;
- a prophecy of inevitability or a denial that correction, defection, de-coupling, or successor formation can interrupt the path;
- established merely because a programme transmits anti-futurist language.

The diagnosis requires evidence that propagation advances a terminal organizing logic, positive settlement or credible stopping conditions are absent or recurrently refused, damage accumulates in the carrying substrate, and terminal discontinuity increasingly explains the system's direction. If destructive transition remains bounded and answerable to a credible, habitable successor order, the case may instead be severe but instrumental conflict within a life-drive project.

Situated scripts and open questions Situated scripts supply another possible transition mechanism without deciding a constitution's orientation. Uneven unraveling of family, occupational, civic, or constitutional scripts can generate loss, incompatible improvisation, blame, and rival successor projects; antagonism may then respond to breakdown rather than cause it. Conversely, a death-drive programme may corrode incumbent scripts or keep contest scripts activated after their triggering problem has been resolved. Script viability is independent of drive orientation: an oppressive or death-driven script can be viable, and a life-serving script can fail for lack of competence, interface, institution, or material support.

Open questions include:

1. Can the orientation be operationalized without pretending that its several mechanisms form one calibrated scalar?
2. What is the proper unit and scale: demand, fantasy, script, mythology, institution, epistemic constitution, distributed field, or whole society?
3. Which positive goods can be stated without granting an interpreter epistemic sovereignty over other persons' good?
4. Which observations distinguish necessary opposition and genuinely new problems from adversary-dependent identity or renewable conflict?
5. What counts as a genuine stopping condition, completion, reconciliation, maintenance phase, or return to ordinary contestability?
6. How do lack, desire, fantasy, finite and renewable demand, jouissance, *Beseelung*, and institutional incentives contribute without being collapsed?
7. When does reciprocal conflict become antagonistic over-coupling, and what additional integration would justify positing a conflict-level agent?
8. How does drive orientation interact over time with cultural interoperability, Babelization, subjecthood absorption, order level, jurisdiction, and corrigibility?
9. Does observed antagonism cause script unraveling, respond to it, contain successor-script competition, or become a self-sustaining script that outlives the failure that activated it?

15.3 Candidate sacred-principal allocation audit—not yet an orientation

Who or what receives ultimate standing, and who or what becomes its instrument?

The assistant proposed this governing question during the Humanism–Diversity analysis; the project author selected it for evaluation while explicitly withholding acceptance as a constitutional orientation.

Sacred-principal allocation is retained as a candidate cross-constitutional audit. It asks how a mythology and its institutions distribute the principal–instrument relation among concrete persons, collective subjects, categories, ecosystems, impersonal patterns, future conditions, institutions, tools, and programme continuation.

The candidate is evaluated against the requirements for an independent constitutional classification orientation:

Required element	Present specification	Current difficulty
Independent governing question	What or whom does the order finally serve when protected goods conflict?	The question is plausibly independent of factual truth and motivational drive, but overlaps the existing service-direction audit and subjecthood-absorption analysis.

Required element	Present specification	Current difficulty
Unit	A specified mythology, Culture Program, institution, constitution, policy domain, or decision interface	Allocation can differ by domain inside one order; whole-society labels would conceal this variation.
Scale and period	Local, institutional, constitutional, or civilizational allocation during a named period	Declared principle, legal standing, administrative operation, and long-run effect can diverge.
Candidate endpoints	Concrete-person primacy ↔ collective, ecological, or impersonal-pattern primacy	The proposed right-hand "pole" combines several non-equivalent principals; plural stewardship and side constraints do not necessarily form one continuum.
Observable evidence	Rights floors, final appeal, authorized sacrifice, beneficiary and burden patterns, refusal and exit, exceptional cases, correction, and temporal service direction	Formal declarations may differ from operative budgets, metrics, exception rules, and treatment of outliers.
Boundary cases	Guardianship for infants, future persons, and nonhuman life; public goods; emergency sacrifice; ecosystems required for human survival; voluntary collective projects	Instrumental service, mutual dependence, fiduciary representation, and constrained trade-off must not be misclassified as total subordination.

The independence case is real but incomplete. A reality-anchored constitution could truthfully give an ecosystem priority over immediate consumption while remaining predominantly life-drive. A Humanist constitution could lie systemically or organize a self-consuming circuit. Truth orientation therefore does not decide principal allocation, and principal allocation does not decide drive orientation.

Yet an orientation needs more than independence examples. The current candidate lacks a defensible pair of exhaustive or directionally opposed poles. It may instead describe a **typed allocation map**: several principals can possess standing at once; one can constrain another without becoming its complete master; and the decisive hierarchy can change by jurisdiction. Much of its diagnostic work may already be performed by Humanity inversion, subjecthood absorption, the service-direction audit, and the *Schutzbalken* principle.

Current verdict: use sacred-principal allocation as a non-scalar, cross-cutting audit; do **not** add a third row to the accepted orientation table. Promotion would require:

1. endpoint definitions that do not collapse all nonhuman or collective principals into one pole;
2. evidence and decision rules that distinguish declared from effective principal;
3. inter-rater discrimination beyond truth orientation, drive orientation, service direction, subjecthood absorption, and jurisdiction;
4. successful classification of plural, fiduciary, ecological, emergency, and mixed boundary cases; and
5. demonstrated explanatory or predictive gain across several master signifiers and institutions.

16. Reality-anchored, truth-seeking epistemic constitution

reality-anchored, truth-seeking epistemic constitution *noun phrase* **Status:** positive ideal type and proposed synthetic term

Short definition A reality-anchored, truth-seeking epistemic constitution is a social meta-order that affirms mind-independent reality, protects sincere expression and visible disagreement, organizes a plural search for objective truth, and preserves independent routes by which persons, claims, authorities, institutions, memories, and policies can be corrected.

It is a full lifted capture and a universal meta-order. Its reality-anchoring lies not in incomplete authority but in binding corrigibility: no authorized interpreter receives epistemic sovereignty, and independent reality retains the final right of refusal.

Constitutive properties Its defining properties are:

1. **Realism:** something exists independently of authorization and collective preference.
2. **Fallibilism:** every human model and authority may be mistaken.
3. **Truth-seeking:** inquiry actively attempts to discover what is the case rather than merely professing respect for truth.
4. **Truth-tracking:** the order evaluates whether its procedures actually improve prediction, explanation, and contact with evidence.
5. **Public avowal integrity:** people can express belief, doubt, ignorance, and revision without being required to falsify their judgment.
6. **Open contestability:** consequential disagreements remain visible and their serious proponents receive standing to defend them.
7. **Corrigible dependence:** expertise and institutions remain indispensable but defeasible, externally auditable, and limited to jurisdictions allocated by the universal meta-order.
8. **Plural correction routes:** independent sources, methods, institutions, and observers reduce synchronized error.
9. **Communicative integrity:** language facilitates shared examination rather than covertly substituting operative effect for truth.
10. **Epistemic stewardship:** individuals treat amplification and collective attention as responsibilities.
11. **Due process:** contradiction is inexpensive, while consequential condemnation requires tested evidence and remedy.
12. **Honourable correction:** admitting error and changing one's mind are signs of fidelity rather than humiliation.
13. **Moral individualism:** persons retain unconditional dignity while propositions receive conditional confidence.

Its lifted mechanical solidarity is not agreement on a comprehensive worldview. It is shared honour around the conditions under which disagreement remains truth-seeking:

> People like us say what we actually believe, examine what we most want to believe, give opponents a fair hearing, preserve evidence, and let reality correct us.

Truth-preserving culture as a roadblock to *Machtpolitik* **Truth-preserving culture** is the practical cultural and institutional profile of this reality-anchored constitution. It keeps politically harmful truths speakable, politically useful errors rejectable, standards reciprocal, predictions and earlier claims recoverable, independent observers and evidence available, dissent protected, and appeal and correction capable of changing practice. It is not a new constitutional orientation and does not mean that every current proposition is true. It names a culture whose operative honour, incentives, records, and institutions preserve the conditions under which authorized accounts can lose.

Under the project's strict definition of ***Machtpolitik***, the relation is:

```
Machtpolitik -> systemic-lying core
operative truth-preserving culture -> no systemic-lying core
therefore, operative truth-preserving culture -> no Machtpolitik
```

This makes truth-preserving culture a simple and central **preventive roadblock**: it denies *Machtpolitik* one of its necessary constituents. The claim is definitional at the ideal-type level, not an empirical promise that a truth-oriented society cannot be captured. A culture may preserve truth in some domains while systemic lying stabilizes in another; nominal truth commitments may conceal captured records or incentives; and a sufficiently powerful actor may destroy the relevant people and institutions.

The countermeasure therefore requires more than fact-checking. Its practical supports include independent evidence and observers, reciprocal law and standards, protected dissent and harmful truth, durable records, visible failed predictions, plural material and institutional independence, appeal, correction, reviewable classification of political or emergency exceptions, and consequences for deliberate falsification or record destruction under due process. It is specifically a roadblock to *Machtpolitik*, not a complete defence against **open authoritarianism** or **naked domination**, which can avow force without constructing a systemic-lying core. The corresponding pluralist constitutional application belongs to the *Schutzbalken* crosswalk.

17. Systemic-lying epistemic constitution

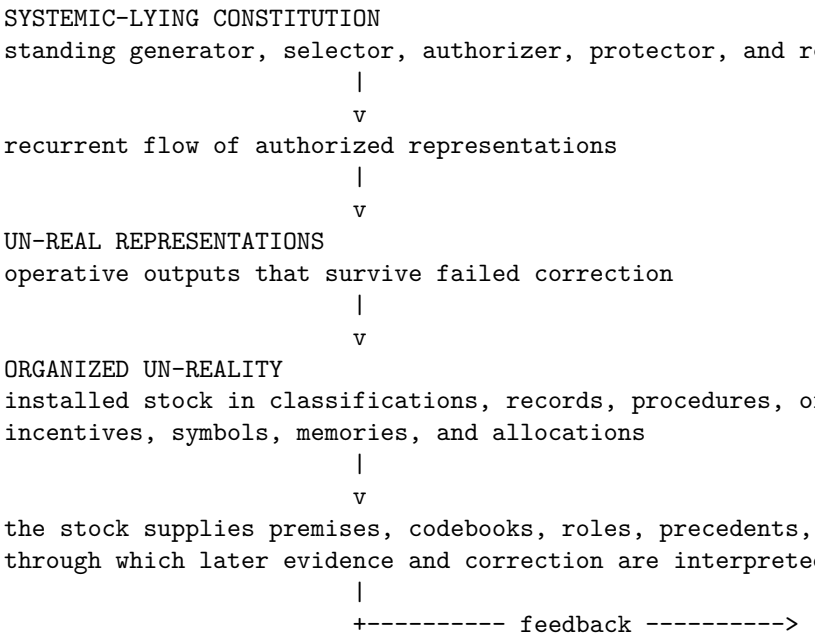

systemic-lying epistemic constitution *noun phrase* **Status:** pathological ideal type and proposed synthetic term

Short definition A **systemic-lying epistemic constitution** is a social meta-order that recurrently generates, selects, authorizes, protects, and replaces organized un-reality because its correction relations subordinate independent truth to operative usefulness, loyalty, control, or authority. Public communication, institutional authority, social incentives, language, memory, and routine participation are thereby organized to reproduce authorized representations while sincere avowal, contradictory evidence, genuine disagreement, and independent correction are suppressed, distorted, ritualized, or made prohibitively costly.

It too is a full lifted capture and a universal meta-order. Its pathology lies in how its representatives and rules monopolize interpretation, block succession and correction, and make reality answerable to authorization—not in the mere fact that one second-order order governs society-wide jurisdiction rules.

Recurrent does not mean uninterrupted output. A standing correction structure can remain systemically closed during quiet periods. **Generation** is only one operation: accurate fragments can be selectively arranged into a misleading model; offices and procedures can authorize it; silence, ritual assent, memory control, incentives, inertia, or correction nullification can protect it; and a successor account can inherit the defeated representation's classifications and utility.

The stock–flow–feedback relation is:

The constitutional classification therefore does not assert that every proposition is false, every carrier knows it is false, or one centre designed the order. The system can function as though it were lying through mixtures of deliberate deception, sincere belief, role obedience, fragmented knowledge, incentives, and institutional self-protection. What is systemically inverted is the relation between authorized representation and independent correction.

Constitutive properties Its defining properties include:

1. **Un-reality through reality substitution:** the authorized model acquires operative reality-status and priority over what observation, prediction, and consequence reveal.
2. **Public–private divergence:** people learn to say what participation requires rather than what they believe.
3. **Ritualized assent:** performance matters more than private conviction; visible compliance confirms the system.
4. **Authority-gated updating:** source authorization determines whether evidence may count.
5. **Asymmetric epistemic permeability:** in-group claims enter easily; inconvenient evidence faces exceptional burdens.
6. **Conflation of loyalty and truth:** disagreement becomes betrayal, impurity, danger, or moral defect. This is semantic and institutional conflation, not by itself subjecthood absorption (fusion).
7. **Institutional synchronization:** nominally independent institutions reproduce the same classifications and common-mode failures.
8. **Semantic capture:** words, frames, causal stories, and moral labels preselect what can be perceived, blamed, or remedied.

9. **Attention exhaustion:** flooding and repetitive low-cost claims reduce society's capacity to identify and examine important disagreements.
10. **Denunciatory enforcement:** accusations against designated persons become cheap while contradiction of authorized claims becomes costly.
11. **Memory control:** failed predictions, dissent, alternative explanations, and earlier meanings disappear from the usable record.
12. **Self-sealing correction:** the institution defines criticism as proof of hostility and failure as evidence that more commitment is needed.
13. **Distributed reproduction:** ordinary people become the execution layer by forwarding, concealing, performing, rewarding, and sanctioning.

Un-reason can help generate several of these properties by turning articulate reasoning into an immunization system for the authorized account. It is neither a necessary nor a sufficient condition of systemic lying: an order may suppress correction through brute authority with little intellectual machinery, while a localized pocket of un-reason may remain contestable and constitutionally contained.

Benda's truth–utility bridge Julien Benda's *La trahison des clercs* supplies a historically situated political pathway into this pole. His *clercs* are people whose intellectual vocation should bind them to disinterested and universal values such as truth, reason, and justice. Their betrayal occurs when intellectual authority is instead used to dignify practical political passions. Benda's sharp epistemic formulation is that embracing a useful error or "myth" can be presented as honourable, while admitting a truth harmful to the group can be made shameful.

The fuller Benda bridge also preserves his secondary motifs of moralized strength, reciprocal constraint disparaged as weakness, the factionalized state, punished independent judgment, instrumental contempt, and national infallibility. They are possible manifestations of truth–utility inversion, not defining properties of systemic lying and not sufficient evidence of *Machtpolitik*.

At the transmission level, a *clerc* can also carry the project's **trusted-opinion-leader function**: the relevant field recurrently refers judgment to the person, so the person's authorization gains privileged credibility, translation, and cascade. The source term and receiving-field function remain distinct. Not every *clerc* possesses operative field trust; not every trusted opinion leader claims an intellectual vocation; and neither classification establishes betrayal or falsity. *Culture Program Ecology* owns the application in which their overlap helps build the systemic-lying core of *Machtpolitik*.

In the present vocabulary, this is a **truth–utility inversion**:

```
political usefulness
→ intellectual, moral, and epistemic authorization
→ useful error becomes honourable
→ harmful truth becomes disloyal, shameful, or inadmissible
→ independent correction weakens
→ possible movement toward systemic lying
```

This pathway connects the truth orientation to ***Machtpolitik*** without making them coextensive. Under the project's strict definition:

```
Machtpolitik -> systemic lying
systemic lying -/-> Machtpolitik
```

Systemic lying is a necessary constituent because *Machtpolitik* recruits clerc-like authority and Culture Mechanics to convert factional usefulness into apparent goodness, truth, and reciprocal legitimacy while insulating beneficiaries from correction. But a systemic-lying constitution may lack a power-seeking beneficiary, capture of ideological-power capability, bandit–carrier payoff asymmetry, or the other components required for *Machtpolitik*. Openly avowed domination without systemic lying is instead open authoritarianism or naked domination in this project's usage. The full composite definition, morality–politics sequence, and relation to *Willkürherrschaft* belong to *Culture Program Ecology*.

Baader supplies a direct later reception bridge from this vocation-level account to an operational semantic method. In *totgedacht*, his section "Verrat der Intellektuellen," pp. 124–126, immediately precedes "Marsch durch die Definitionen", pp. 127–128. The sequence connects clerc-like betrayal and moral immunization against facts to the hollowing and reinterpretive occupation of definitions as a further method. That sequence is Baader's reception of Benda; Benda does not thereby become the source of the project's typed route from persuasive redefinition into possible un-reason, un-reality, Babelization, or institutional substitution.

Fraenkel's *Normenstaat–Maßnahmenstaat* distinction supplies a neighbouring institutional implementation. A regime can preserve substantial norm-governed legal regularity while politically selected cases lose reciprocal guarantees and effective review. Where that selective normality is presented as universally binding, or the override is concealed, euphemized, or moralized, the dual-state topology can help reproduce systemic lying. The topology alone does not establish this truth orientation: a prerogative override may be openly avowed, and *Doppelstaat*, systemic lying, *Machtpolitik*, and *Willkürherrschaft* remain distinct classifications.

This is one pathway, not the definition of systemic lying. Benda's account is a polemical diagnosis of particular intellectual and political transformations, not a classification of intellectuals as a population. Sincere belief, conformity, institutional selection, and distributed repetition can reproduce the inversion without every carrier knowingly lying or one centre designing it.

The word **lying** is broad at this pole. A systemic-lying constitution need not consist entirely of consciously false sentences. It may contain:

- true statements selected to produce a false overall model;
- sincere believers repeating culturally installed errors;
- officials indifferent to truth rather than privately certain of falsity;
- accurate propositions repeated insincerely as rituals of submission;
- euphemisms, implications, omissions, presuppositions, frames, and classifications that evade literal falsehood;
- institutions that preserve local accuracy while protecting a globally misleading narrative.

The constitutional scale can therefore include organized control of the **reconstruction pipeline**, not only organized production of false sentences:

```
admissible event model
        ↓ compressed through approved vocabulary, omissions, and sequence
trusted speakers and institutions repeat the compressed form
        ↓
installed recipient codebooks supply the expected decompression
        ↓
ordinary participants may sincerely reconstruct and enforce the authorized model
        ↓
alternative decompressions are marked ignorant, immoral, or inadmissible
```

Epistemic Agency under Mechanical Solidarity, "Audience-modelled reconstruction and decompression" defines the person-to-message mechanism and decompression audit. The constitutional claim is narrower than an intent attribution: no conscious liar is required at every node, and the same communication tools can serve honest compression when uncertainty, alternatives, and correction remain available.

Two mythology-construction mechanisms can help close this pipeline. **Doctrinal causal omission** offers reflective cognition an attractive public doctrine while withholding the affective and institutional mechanism on which its implementation relies. ***Herrschaftsideologie*** then converts claimed privileged access to truth, history, morality, or a collective's hidden interest into governing jurisdiction. Neither is necessary for systemic lying, and legitimate expertise is not thereby condemned. Together they identify one route by which an authorized interpreter can make disagreement prove the dissenter's incapacity and insulate the operative model from correction.

What makes the constitution systemic-lying is not the falsity of every component. It is the organization of the whole order against independent correction.

18. Intermediate and mixed constitutions

Everything between the endpoints consists of partial, unstable, and domain-specific combinations. Useful intermediate descriptions include:

- **truth-professing but weakly truth-tracking:** truth is praised, but predictions, audits, and correction records are poor;
- **procedurally open but socially punitive:** formal speech rights exist, but dissent carries severe informal costs;
- **sincere but reality-detached:** people speak honestly, yet inquiry lacks adequate evidence, method, or willingness to revise;
- **locally un-real but externally corrigible:** one authorized representation governs a policy, office, discipline, or institution despite failed correction, while rival institutions and wider public procedures can still expose, limit, reverse, or repair it;

- **technically accurate but publicly insincere:** institutions possess good local knowledge while requiring ritual public assent;
- **plural but authority-gated:** several institutions exist, yet all depend on the same source, incentives, or master classification;
- **dissident but closed around successor gatekeepers:** an alternative community protects disagreement from the mainstream while its own gatekeepers preempt symmetric evaluation and correction; rivalry alone is not the pathology;
- **corrigible in ordinary cases but closed around sacred claims:** correction works until identity-defining propositions are threatened;
- **transparent but denunciatory:** records are available, yet person-directed accusation lacks symmetrical due process;
- **free-speaking but attention-corrupted:** no one is formally silenced, but flooding and algorithmic competition bury consequential disagreement.

This prevents a simplistic classification of whole societies as "truthful" or "lying." The analytical question is always: **which mechanisms on which dimensions currently control the correction loop?**

19. Movement within the tension space

Movement toward the reality-anchored pole occurs when a system:

- reduces the penalty for sincere uncertainty and disagreement;
- separates personal dignity from propositional correctness;
- makes claims rather than enemies the primary unit of dispute;
- opens evidence and provenance to independent inspection;
- limits authority by domain and separates coordination from truth certification;
- creates independent correction routes and preserves minority analyses;
- stages consequential disagreements without issuing an institutional winner;
- records predictions and revisits them after outcomes occur;
- makes correction, appeal, and institutional repair visible;
- installs epistemic stewardship as an admired everyday virtue.

Movement toward the systemic-lying pole occurs when a system:

- makes public performance increasingly independent of private judgment;
- treats consensus as evidence even when expression is pressured;
- conditions admissibility on institutional or identity authorization;
- fuses moral worth, belonging, and factual assent;
- closes or synchronizes nominally independent sources;
- substitutes labels, frames, and accusations for examination;
- makes contradiction costly and condemnation cheap;
- overwhelms attention with untested claims;
- erases failed predictions and embarrassing evidence;
- rewards participants for reproducing the authorized account.

Because the cycle is recursive, early changes can compound. Sincere dissent makes disagreement visible; visible disagreement reduces isolation; reduced isolation lowers the cost of further sincerity. Conversely, public conformity creates apparent consensus; apparent consensus increases deference; deference strengthens authorities able to impose further conformity.

The two poles must therefore be kept together conceptually. Each positive safeguard is intelligible partly as the reversal of a negative mechanism, and each negative mechanism can be diagnosed by identifying the route of correction it disables.

Normative and diagnostic summary

20. Core constitutional principles

1. **Reality exists independently of social authorization.**
2. **No individual or institution is identical with objective truth.**
3. **Sincere avowal is the social starting condition of collective inquiry, not proof of correctness.**
4. **Epistemic dependence is unavoidable; epistemic sovereignty is not.**

5. **A lifted constitution shares rules that generate, select, apply, and revise concrete answers; it may govern universally while producing bounded first-order jurisdictions.**
6. **Disagreement is information before it is pathology; permanent contestability is required, permanent contest is not.**
7. **Contradiction should be inexpensive; condemnation should require evidence and due process.**
8. **Publicity should expose opposing propositions, not appoint an official winner.**
9. **Independent correction routes are constitutional infrastructure.**
10. **Attention is a finite epistemic commons.**
11. **Correction and mind-changing should carry honour rather than shame.**
12. **Persons deserve unconditional dignity; propositions deserve confidence proportionate to evidence.**
13. **Reality retains the final right of refusal.**
14. **A constitutional rule is operative only when viable scripts translate it into role-, institution-, and situation-specific conduct and correction.**
15. **Truth orientation and drive orientation are independent:** factual accuracy does not make a circuit life-serving, and a claimed life-serving telos does not establish truthfulness.
16. **Censorship of relevant correction is a fault sentinel, not a complete diagnosis:** high detection power can coexist with low localization power.
17. **Legality cannot independently validate a censorial boundary that produced the illegality on which its own defence relies.** Test the concrete reciprocal right, symmetry, evidence, jurisdiction, review, appeal, and repair.
18. **No model may control which experiences are allowed to become questions about that model.** Question-space and appealability are constitutional infrastructure.
19. **A bounded mechanism must be able to lose jurisdiction.** Success can widen confidence; failure, changed preconditions, capture, or harm must be able to narrow scope, change custody, or retire the programme.
20. **Foundational knowledge includes the originating question, rivals, failures, causal record, and reopening conditions—not only the inherited answer.**
21. **Meaning infrastructure requires counterpower.** Formal separation of state powers is incomplete where one carrier ecology monopolizes education, classification, credentials, interpretation, and public reception.
22. **Science does not silently authorize prophecy.** The transition from evidence and causal inference into value selection, synthesis, and political jurisdiction must be named and remain corrigible.
23. **Removing the me may reveal the we, not yet the world.** Freedom from private-position privilege does not by itself expose or correct the shared conceptual frame through which everyone judges.
24. **Objectivity is corrigible collective formation, not absence of collective formation.** A truth-seeking order must permit the world to revise both an answer and the inherited grammar that made the answer appear obvious.
25. **Collective persistence is evidence of reproduction and possible partial fit, not decisive objectivity.** Endurance can coexist with delayed, buffered, misattributed, or displaced costs and with a shared grammar that makes counterevidence difficult to recognize; ask what was repeatedly tested, who bore the consequences, and what could make the frame lose.
26. **Social mediation is unavoidable; epistemic sovereignty of the mediation is not.** A shared framework can organize contact, comparison, and communication without acquiring authority to decide what the object may do; repeatable success and resistant failure must be able to revise the frame. A procedure can be sincerely disciplined and feel impartial because its local epistemic grammar has become transparent to participants; neither the coolness of that experience nor the absence of private advantage establishes culture-transcendent objectivity.
27. **World interruption and You interruption are independent constitutional safeguards.** Consequences can defeat a personally attractive story, and an affected person's claim can reveal what an aggregate measure conceals.
28. **Necessity does not purify authorship.** A person who uses harmful means to protect others must remain answerable for the judgment, alternatives, proportionality, consequence, stopping condition, and repair; the authorizing collective cannot outsource the whole burden to its executor.
29. **Observation is a typed social achievement, not raw reality or arbitrary construction.** Resistant conditions and sensing architecture jointly shape what becomes available for public correction.
30. **Causal efficacy is not independent validation.** An operative representation can help generate the conduct, institution, or observation later cited in its support; the produced result can be real while proving less than the complete programme claims.
31. **Feedback boundaries must be mapped together.** Co-authorship, jurisdiction, consequence bearing, and operative correction need sufficient congruence for a democratic learning loop to close.
32. **Correction independence is operational.** An adverse result counts as independent only where it can survive reception and alter consequential rules, appointments, resources, jurisdiction, or succession without the tested custodian retaining the final veto.

21. Diagnostic questions

- Would the judgment survive exchange of the persons or positions while materially relevant structure remains?
- Which collectively learned concepts, methods, authorities, and standards made the judgment appear natural, and what common assumption would not be removed by cancelling private interests?
- What shared operation, failed prediction, resistant object, or consequence could revise the framework rather than only generate another answer within it?
- Can an affected person alter classification, permission, operation, or jurisdiction, or can the system know that person in detail only as a case?
- Does resistance reopen encounter and review, or become confirming evidence for the classification that authorized the intervention?
- If harmful protective action is proposed, who owns the necessity judgment, what lesser alternatives were tested, when must the action stop, and who owns error and repair afterward?
- Is the distributed epistemic milieu functioning as an open atmosphere, an epistemic fog, or a self-sealing enclosure for this domain, and what evidence distinguishes difficulty of access from protection of an answer?
- Does the apparent impartiality mark removal of private-position privilege, ordinary use of a locally shared procedure, or demonstrated exposure of that procedure to reality-mediated correction?
- Does a representation persist because it repeatedly survives independent correction, because it coordinates a bounded practice adequately, or because adverse costs and observations are delayed, buffered, displaced, or inadmissible within the inherited grammar?
- Can a person publicly say "I doubt," "I do not know," or "I changed my mind" without losing ordinary membership?
- Does public speech plausibly reveal private judgment, or mainly the anticipated cost of expression?
- Are authorities trusted because of inspectable competence and performance, or because their authorization decides admissibility?
- Can an inexpensive direct check defeat an authorized claim?
- Are identical claims judged differently under friendly and hostile branding?
- Are important disagreements made visible with their strongest genuine proponents?
- Is low conflict the result of successful correction and accepted procedure, or of silence, exclusion, exit, memory loss, and rival-signal suppression?
- Can a new consequential challenge become visible and effective even after a long calm period?
- Do people and institutions still know how to enact dissent, investigation, appeal, legitimate loss, succession, correction, and return, or do only their written forms survive?
- Is the observed failure located in the meta-order, a situated constitutional script, a particular enactment, an inter-script interface, or missing practical capacity?
- Does a public epistemic demand state an observable condition of satisfaction, revision, or termination?
- Which fantasy-supported subject position or institutional role is rewarded by keeping the demand unresolved?
- What independently valuable good would remain if the named opponent or norm disappeared?
- Can the programme name a stopping condition after which conflict may end and ordinary maintenance, relationship, or construction resume?
- Does satisfying one demand permit completion, or reclassify the result as normalization, accommodation, compromise, or evidence for a successor demand?
- Is conflict a standing possibility within permanent contestability, or a permanently activated source of identity and motivation?
- Does repetition build and transmit capabilities and relationships, or consume the programme's human, institutional, and intergenerational carriers?
- Does successful propagation enlarge future-supporting capacity, or make the programme's terminal logic more capable of consuming the containing order and its own substrate?
- Whom or what does the resulting power serve: declared users, effective beneficiaries, a competitive selection pressure, programme continuation, concrete life-supporting forms, or a self-consuming trajectory?
- Do persons remain principals who can redirect and stop the capability, or are they becoming instruments of its continuation and demands?
- Which persons, collectives, abstractions, ecosystems, patterns, institutions, or future conditions possess standing in this domain, and what happens when their claims conflict?
- Does the effective principal shown by rights, sacrifice, budgets, metrics, exceptions, outlier treatment, and final appeal match the declared principal?
- Does a moderator preserve symmetry or issue epistemic verdicts?
- Are evidence, provenance, uncertainty, predictions, dissent, failures, and corrections preserved?
- Can institutions admit error without redefining the error or punishing the person who exposed it?
- Do nominally independent institutions rely on genuinely independent causal routes?

- Is checking one's own side honoured more than rapidly forwarding its claims?
- Does an anonymous report trigger investigation or function as proof of guilt?
- Are accusations precise, answerable, appealable, and repairable after error?
- Does the language of care, safety, justice, science, tradition, or freedom open inquiry or terminate it?
- Does the public doctrine disclose the affective and institutional mechanism on which its expected implementation depends?
- Does anyone claim privileged access to a hidden collective interest and convert that claim into jurisdiction over persons who disagree?
- Which experiences and analogies are permitted to become questions, and which answer, office, or programme controls their reception and reopening?
- Does the challenged claim admit an appeal to reciprocal reason, independent evidence, affected persons, another institution, succession, or material consequence outside its own custody?
- What failure can contract the mechanism's jurisdiction, replace its custodian, restore a missing precondition, or end the intervention?
- Does an inherited conclusion still carry its originating question, serious rivals, failed alternatives, consequences, and conditions of reopening?
- Where does empirical explanation end and authored value synthesis or political prophecy begin, and is that transition visible?
- When a participant says "I have reasoned for myself," can they identify the verdict's operative rule, affective signature, provenance, framing, and authority—and can evidence or consequence actually change it?
- Does reasoning expose a protected conclusion to possible defeat, or continually redesign the concepts, burdens, exceptions, and standards by which that conclusion survives?
- Which representation currently possesses operative reality-status, what decisions or allocations does it govern, and which observation or consequence could reduce that authority?
- If contradiction has become publicly speakable, has it changed confidence, classification, action, resources, jurisdiction, remedy, personnel, or rule—or does the institutional procession continue?
- At which correction stage does uptake fail: *Speak, Record, Receive, Answer, Adjudicate, Change operation,* or *Repair*? Who has custody of the next stage, and can an independent route displace their non-response?
- Was the adverse signal accurately received and counted but converted by a threshold, default, timing, agenda, quorum, routing, expiry, or restart rule into continuation? Was that rule stable and reciprocal, or selected, moved, or repurposed after the likely correction became known?
- Is opposing correction still privately formable, publishable, discoverable, receivable, organizable, and capable of consequential uptake, or has one of those stages been chilled, criminalized, excluded, or routed through an unreviewable private proxy?
- Does a speech restriction attach to a predeclared reciprocal-right violation, or did authority manufacture the category of unlawfulness after identifying the correction, speaker, or result it wanted disabled?
- Does the observation establish only a strong censorship sentinel, or also localize a protected representation, reason-shaped immunization, recurrent multi-channel installation, constitutional reproduction, and responsible actors?
- Has a representation been independently defeated but remained operative? Does the authority acknowledge the correction while conduct persists, or nullify it through silence, omission, delay, agenda control, or continued repetition?
- Can the affected representation, decision, office, or enforcement function be boundedly de-authorized without requiring conversion, collective punishment, or jurisdiction over the whole person?
- What observation, contradiction, failed prediction, adverse consequence, or rival explanation would lower confidence, and has such an event ever done so?
- Are contextual distinctions stated in advance and applied reciprocally, or invented after challenge for one identity, authority, or programme?
- Do institutions cultivate auditors of their generators and interpretations, or merely articulate press secretaries for protected conclusions?
- Does invocation of Humanity protect each concrete person's standing, or create an abstract subject permitted to override it?
- What observation would make the dominant model lose confidence?
- Who, if anyone, has been granted practical power to overrule reality?
- Do participants share concrete rules and answers, or the rules that generate, select, apply, and revise them?
- Which meta-rules govern the creation, allocation, limitation, interaction, succession, appeal, and correction of the first-order outputs or jurisdictions at issue?
- Is a particular person or institution being called "universal" when only the lifted constitution has universal jurisdiction at its own level?

- Is the constitution first-order or lifted, is the slot fully occupied, and are its rules and representatives corrigible? These are separate questions.

22. Compact formulas

Neutral genus:

> **epistemic constitution = the operative social meta-order governing authority, avowal, evidence, disagreement, memory, attention, and correction**

Present constitutional classifiers:

> **truth orientation: reality-anchored truth-seeking $\leftrightarrow$ systemic lying**
>
> **drive orientation: life-drive $\leftrightarrow$ death-drive**

Candidate audit retained outside the classifier:

> **sacred-principal allocation: who or what receives ultimate standing, and who or what becomes its instrument?**

Order and jurisdiction:

> **full lifted capture → fixed M + current K_t + situation C → binding R_t(C); where M governs universally, it can constitute, allocate, limit, succeed, and correct first-order jurisdictions while representatives receive no root access to reality**

Me–we–world correction:

> **remove private privilege → expose the collectively learned frame → let shared operations and mind-independent consequences correct both answer and frame → separately audit what and whom the corrected capacities serve**

Culture-propagator correction projection:

> **operative representation and authorization → conduct and institutional enactment → worldly consequence → sensing and publicly available observation → challenge, adjudication, and revision or non-revision → altered representation, operation, and retained memory**

Feedback-boundary congruence:

> **continuing co-authors + persons and domains bound + consequence bearers + effective correction routes → sufficiently closed political learning loop; demographic or territorial overlap alone is insufficient**

Endogenous confirmation:

> **R becomes operative → R helps produce response or observation O → O is returned as apparently independent evidence for R; O occurred $\neq$ R independently predicted O $\neq$ the complete programme containing R is uniquely validated**

Independent correction remainder:

> **preserve observations, testimony, comparison, and consequences that the tested representation–institution complex cannot completely elicit, select, classify, interpret, and adjudicate by itself; formal receipt is insufficient unless adverse evidence can survive custody and alter operation**

Open reality–person circuit:

> **encounter → representation → shared authorization → enactment → World interruption and You interruption → revision; DCL–We closure instead routes produced resistance, suffering, anomaly, or failure back into confirmation**

Tragic protective responsibility:

> **credible threat + necessity + proportionality + bounded authority + review and stopping conditions + continuing authorship → possibly least-wrong protection, never moral purification**

Distributed-milieu conditions:

open epistemic atmosphere → correction remains usable; epistemic fog → the relevant relation is difficult to form or share; self-sealing epistemic enclosure → a protected answer governs why correction cannot count

Anti-gnostic adaptive learning:

constraint shell → plural proposals → bounded intervention → independent and differently vulnerable sensors → correction, rollback, or succession; no actor owns the objective, evidence, implementation, aggregation, and verdict

Voegelinian existential and question-space layer:

finite participation in reality + living foundational questions → corrigible symbolization; closed construction controls what experience may signify and which questions may form → Second Reality and possible untrue existence → possible un-reason, un-reality, and wider reality-matrix divergence

Bounded-mechanism correction:

real mechanism + specified preconditions + bounded jurisdiction + failure can narrow scope → corrigible use; inherited credit + precondition blindness + non-contracting jurisdiction + expansion after failure → candidate governing theology

Foundational-question custody:

question + experience + rival answers + causal record + defeated errors + reopening conditions → living foundational knowledge

Generational symbol continuity:

inherited token or formula + preserved operation path + recurrent formation and correction → reconstructed decompression capacity → living, applicable, and corrigible symbolization

Truth-orientation positive pole:

sincere avowal → visible disagreement → plural inquiry → encounter with reality → correction → sincere revised avowal

Truth-orientation negative pole:

social pressure → public performance → apparent consensus → authority-gated knowledge → suppressed correction → organized un-reality

Censorship sentinel:

nonviolent evidence-bearing correction disabled → high-confidence fault in the correction interface → localization, causal diagnosis, scale test, and attribution remain separate

Bootstrap illegality:

correction threatens authority → prohibition manufactures unlawfulness → manufactured unlawfulness is cited to justify suppression; legality cannot independently validate the operation that produced it

Un-reason mechanism:

reasoning capacity → protected conclusion → asymmetric concepts, burdens, and exceptions → criticism redescribed as confirmation → independent correction closes

Un-reality state:

authorized representation → operative reality-status and practical jurisdiction → independent contradiction cannot alter authority or use → possible organized un-reality

Mechanism–state relation:

un-reason can explain why counterevidence cannot count; un-reality is the condition in which the protected representation continues to govern despite that failed correction

Post-disclosure branches:

publicly speakable and independently sustained correction + continued operative authority → defeated-but-operative un-reality → acknowledged continuation through procession inertia or unacknowledged continuation through correction nullification

Correction pipeline:

> **Speak → Record → Receive → Answer → Adjudicate → Change operation → Repair; speech without a consequential receiver can remain a dead-letter correction**

Procedural correction conversion:

> **adverse correction validly received and recorded → procedural operator converts it into failed rejection, continuation, or a new authorization opportunity → accurate counting $\neq$ consequential correction**

Bounded exit from carrier veto:

> **independently sustained correction + authorized and proportionate procedure → bounded de-authorization of the defeated representation or specified carrier-function $\neq$ conversion, whole-person defeat, or collective punishment**

Doublethink mechanism:

> **incompatible authorized beliefs → compartmentalization or authority-governed switching → contradiction loses corrective force**

Benda truth–utility pathway:

> **political usefulness → clerc-like moral and epistemic authorization → useful error honoured and harmful truth shamed → possible systemic lying**

Life-drive pole:

> **open desire → chosen limits and reality-facing finite projects → capability, relationship, creation, repair, and maintenance → genuine completion → transmission and renewed possibility**

Death-drive pole:

> **open desire → constitutive negation or adversary → renewable demand, refusal, or conflict → resolution threatens identity or reward → closure becomes accommodation or betrayal → self-consuming repetition**

Ragnarök trajectory:

> **successful propagation → wider installation of terminal logic → maintenance and transmission become instruments of negation → carrying substrate is consumed → containing order and possibly programme lose continuity**

Reconstruction-pipeline capture:

> **authorized event model → approved compression → trusted repetition → installed decompression → sincere reconstruction and enforcement → alternative models punished**

Privileged-vision closure:

> **claimed hidden truth → authorized interpreter → epistemic asymmetry converted into jurisdiction → disagreement proves incapacity → correction closes**

Individual virtue:

> **verify, qualify, or withhold**

Public contestability:

> **the institution detects and stages disagreement; the public judges; reality decides over time**

Motivational branching:

> **open desire + fantasy-supported subject position + cultural and institutional material → finite operational demand answerable to evidence OR renewable epistemic demand protected by repetition, identity, and authority**

Steady-state rule:

> **permanent contestability $\neq$ permanent contest; low conflict can follow successful correction while the standing capacity to challenge remains**

Constitutional implementation:

shared epistemic meta-rules + role/institution/situation → constitutional script → situated conduct, record, and correction; written procedure without viable carriers, interfaces, honour, independence, and support → nominal rather than operative contestability

Moral rule:

respect persons unconditionally; evaluate propositions conditionally by evidence; regulate actions through justice

Ultimate contrast:

A reality-anchored constitution preserves reality's right to correct society. A systemic-lying constitution grants society's authorized representatives the right to correct reality.

Terminological provenance and boundaries

23. Established concepts retained substantially in their source sense

- **Mechanical and organic solidarity — Émile Durkheim:** *De la division du travail social*.
- **Truth as *adaequatio intellectus et rei* — Thomas Aquinas:** *Summa Theologiae* I, q. 16, a. 1 and *De veritate* q. 1, a. 1 supply the correspondence principle that truth requires conformity or agreement of intellect and thing. Aquinas receives and develops this account within a wider metaphysics; the project retains the world-facing correspondence boundary without importing that metaphysics as a whole.
- **Collective concepts, interpersonal harmony, and objective adequacy — Émile Durkheim:** *The Elementary Forms of the Religious Life* expressly denies that collective concepts are averages of corresponding individual representations and describes them as an organized civilizational inheritance containing knowledge beyond the average individual. It also supplies the distinction between harmony among minds and harmony with things, the possibility that accepted collective representations can prevent belief in a sound scientific concept, and the later qualification that society is a particular subject whose representations retain subjective elements. The three-way distinction among positional impersonality, collective or procedural impersonality, and world-answerable objectivity—and the audit of delayed, buffered, hidden, or displaced costs—are Culture Mechanics refinements rather than Durkheim's terminology.
- **"Wir irren uns empor" — Gerhard Vollmer:** GWUP's account of critical discussion attributes the phrase to Vollmer's 1995 Popper memorial essay and uses it for cooperative fallibilist learning through reasons, factual accuracy, viewpoint plurality, and open criticism. ***Bewährung* through corrigible reality contact**, its exposure conditions, and its placement as the diachronic test history of objective adequacy are Culture Mechanics refinements rather than Vollmer's complete epistemology.
- **General will, will of all, and cancellation of private differences — Jean-Jacques Rousseau:** *The Social Contract*, book II, chapter 3 supplies the source comparison. The claim that a cultural premise common to all participants will not cancel, and the center-of-gravity image used to picture that common frame, are project extensions rather than Rousseau's own terms.
- **Epistemic dependence — John Hardwig:** "Epistemic Dependence".
- **Cognitive authority — Patrick Wilson:** *Second-Hand Knowledge*.
- **Epistemic authority and preemption — Linda Trinkaus Zagzebski:** *Epistemic Authority*.
- **Epistemic vigilance — Dan Sperber, Fabrice Clément, Christophe Heintz, Olivier Mascaro, Hugo Mercier, Gloria Origgi, and Deirdre Wilson:** "Epistemic Vigilance". The present synthesis uses their account of vigilance toward communicated information without assuming that individual vigilance alone can repair a systemic order.
- **Preference falsification — Timur Kuran:** *Private Truths, Public Lies*. The present synthesis generalizes the problem from preference expression to public avowal and epistemic telemetry.
- **Living within the lie — Václav Havel:** *The Power of the Powerless*.
- **Refusal to participate in lies — Aleksandr Solzhenitsyn:** "Live Not by Lies".
- **Public dissimulation and acting "as if" — Lisa Wedeen:** *Ambiguities of Domination*.
- **Political lying and factual truth — Hannah Arendt:** *On Lying and Politics*.
- **The banality of evil — Hannah Arendt:** *Eichmann in Jerusalem* supplies the source phrase and trial-centred inquiry. The DCL–We closure and desk-perpetrator configuration developed here is a bounded Culture Mechanics reinterpretation, not Arendt's definition, a complete exegesis of the book, or an exhaustive account of National Socialist perpetration.
- **Language as culture-forming political medium — Victor Klemperer:** *The Language of the Third Reich*.
- **"Marsch durch die Definitionen" — Roland Baader:** *totgedacht*, "Verrat der Intellektuellen," pp. 124–126, and "Marsch durch die Definitionen," pp. 127–128, supplies the verified aphorism contrasting semantic change with the march through institutions, the account of terms being hollowed out and then "occupied" through

reinterpretation, and the source-level connection to failed mutual understanding, Newspeak, and Babylonian linguistic confusion. The first section explicitly treats Benda's *La trahison des clercs*, calls moralized opinion "immun gegen Fakten," and immediately precedes the semantic method, establishing a direct Benda–Baader reception line rather than only a retrospective thematic resemblance. Baader's concrete political judgments remain his own; the typed relation to persuasive redefinition, un-reason, un-reality, Babelization, and pseudomorphic governor substitution is a Culture Mechanics synthesis.

- **Truth and untruth of existence, Second Reality, *metaxy*, and the experience–symbol relation — Eric Voegelin:** "On Debate and Existence" and "Immortality: Experience and Symbol" supply the source vocabulary and the relation among finite participation, closed construction, prohibited questioning, and detached answer-symbols. Question-space governance, its five-operation decomposition, appealability, reality-matrix divergence, participation-to-mastery inversion, the three symbol states, and the typed relation to operation-bootstrapped codebook formation, un-reason, un-reality, and Babelization are Culture Mechanics operationalizations. Voegelin's compactness–differentiation relation supplies the source bridge for comparing functionally related experiential structures without assuming literal identity or genealogy; the explicit comparison rule and its inference limits are the present project's formulation.
- **Economic theology and bounded validity — Alexander Rüstow:** *Das Versagen des Wirtschaftsliberalismus* supplies the source diagnosis in which a conditionally useful mechanism loses its social and institutional preconditions and acquires unconditional scope. Bounded-mechanism deformation, jurisdictional contraction, and the three-object mechanism–signifier–programme separation are project-developed generalizations applied symmetrically beyond markets.
- **Science as vocation and responsible present synthesis — Max Weber and Ernst Troeltsch:** Weber supplies the science–value and conviction–responsibility tensions; Troeltsch supplies historically situated cultural synthesis and its authorship problem. The constitutional science–prophecy boundary and the attribution, revision, and successor-participation rules are Culture Mechanics syntheses rather than a merger of their positions. Christopher Dawson supplies the neighbouring discipline-to-creed warning; its evidential audit is a Culture Mechanics operationalization rather than his complete sociology.
- **"Spencer's Law" — Stephen Davies after Herbert Spencer, received through Roland Baader:** Davies's 2001 article coins the name for an inverse incidence–concern relation he attributes to Spencer. Baader's *totgedacht*, pp. 177–180, adopts the name and emphasizes historical ignorance, residual contrast, and bad-news selection. The project does not treat the inverse relation as a universal social law; **contrast-amplified residual salience**, its audit surfaces, and its typed relation to attention sinks, endogenous observation, and correction are Culture Mechanics developments.
- **The betrayal of the clercs — Julien Benda:** *La trahison des clercs* supplies the abandonment of disinterested truth, reason, and justice for practical political passions, including the useful-error/harmful-truth contrast. The truth–utility pathway, the project-specific rule that ***Machtpolitik* entails systemic lying**, and truth-preserving-culture countermeasure are Culture Mechanics syntheses. The *clerc* remains Benda's term; its mapping to the trusted-opinion-leader function is project-developed.
- **Dual state, *Normenstaat*, and *Maßnahmenstaat* — Ernst Fraenkel:** *The Dual State* supplies the coexistence of norm-governed legal order and politically activated prerogative power in National Socialist Germany. Its connection to systemic lying, *Machtpolitik*, *Willkürherrschaft*, the override audit, and *Schutzbalken* controls is a Culture Mechanics synthesis.
- **Doublethink and Newspeak — George Orwell:** *Nineteen Eighty-Four* supplies the literary-political mechanisms. This theory keeps them distinct and does not treat the novel as empirical validation.
- **Proneness to doublethink — Marija B. Petrović and Iris Žeželj:** "Exploring the Mechanisms that Allow Incompatible Beliefs to Coexist in the Cognitive System" supplies the individual-differences operationalization. It is a narrower empirical construct than Orwell's political mechanism and than the project's un-reason mechanism.
- **Critical discussion — Frans H. van Eemeren and Rob Grootendorst:** *A Systematic Theory of Argumentation: The Pragma-Dialectical Approach*, Chapter 3, "A model of a critical discussion," pp. 42–68, and Chapter 6, "Rules for a critical discussion," pp. 123–157.
- **Queer positionality — David M. Halperin:** *Saint Foucault: Towards a Gay Hagiography*. This document uses the relational, anti-normative sense to distinguish queer positionality from a sexual orientation or stable positive identity.
- **Reproductive futurism, the Child, queer negativity, and death drive — Lee Edelman:** *No Future: Queer Theory and the Death Drive*. The master-signifier-like mapping, the renewal circuit, and the classification of the Edelmanian queer pole as a constitutional limit case are Culture Mechanics interpretations, not terminology attributed to Edelman. The proposed deeper relation to critique–construction asymmetry is a Culture Mechanics hypothesis, not a demonstrated chain of influence from Marxism, Critical Theory, or discourse theory to Edelman.
- **The Grail question and technological service direction — Jonathan Pageau:** his ARC 2026 talk supplies the question of whom technological abundance and power serve and a Moloch-trap account of competitive

escalation, sacrifice, and possible reversal from tool-use to tool-service. The service-direction decomposition and its use as a constitutional drive-orientation probe are Culture Mechanics developments; the accessible transcript is third-party rather than an official ARC publication.

- **Ragnarök — *Völuspá* and Snorri's *Gylfaginning*:** the *Poetic Edda* and *Prose Edda* account supply the foretold catastrophic conflict, destruction of the existing order, and subsequent renewal. **Ragnarök trajectory** is the project's selective temporal mapping, not a source term or a complete interpretation of Norse eschatology.

24. Borrowed concepts deliberately extended or modified here

Term used here	Source	Difference in the present synthesis
Lifted mechanical solidarity	Durkheim's mechanical solidarity, as extended in *Epistemic Agency under Mechanical Solidarity*	Moves common binding force from concrete rules and answers to rules that generate, select, apply, and revise them while retaining the same proposed field-forming mechanism. Plural first-order lives are a possible result, not the definition. *Lifted* is not Durkheim's term.
Lacan's big Other as shared symbolic protocol	Lacan's locus of language, law, and symbolic authority	"On-the-wire protocol" is the functional translation defined in *Culture Mechanics*, not Lacan's definition or a complete exegesis.
Local bigOther	Lacan's big Other, operationally adapted in *Culture Mechanics*	Names the individual sentiment classifier executing the mythological lens. It is neither Lacan's symbolic order nor a synonym for the distributed bigOther.
Mechanical-solidarity field and distributed bigOther	Durkheim's mechanical solidarity and Lacan's big Other, synthesized in *Epistemic Agency under Mechanical Solidarity*	Distinguishes emergent field coherence from the dynamically maintained symbolic-affective network state. These are project-developed extensions, not source-author terminology.
Multi-mind-self	Group-person and group-agency neighbours synthesized with culture mechanics in *Epistemic Agency under Mechanical Solidarity*	Names only a distributed system integrated enough to qualify as a continuing collective agent; it is not required for the definition of an epistemic constitution.
Piety toward the real	Robert Bellah's characterization of Durkheim	Converts Bellah's descriptive phrase into an explicit norm of epistemic and institutional model correction.
Epistemic constitution	Neighbouring use in Jonathan Rauch's *constitution of knowledge* and broader social epistemology	Makes the term a neutral genus spanning both truth-seeking and systemic-lying social orders and joins it to lifted solidarity and culture mechanics. No claim of first use is made.
Public avowal integrity	Kuran's preference falsification and Havel's living within the lie	Extends private–public fidelity from preferences and dissident ethics to belief, doubt, uncertainty, and revision across public epistemic life.
Communicative integrity	Habermas's communicative action and validity claims; pragma-dialectical critical discussion	Adds explicit reality-answerability and a broader inventory of semantic, contextual, and systemic failure modes.

Term used here	Source	Difference in the present synthesis
Reality correction loop	Holistic structural realism; fallibilist and scientific model testing	Generalizes model–prediction–surprise–revision beyond formal science to institutions, narratives, policies, and public knowledge.
Constitutive lack, desire, fantasy, demand, and jouissance	Lacan's psychoanalytic vocabulary, with Žižek's exposition of fantasy as teaching desire and positioning the subject for others	Applies the optional motivational layer to public inquiry and authority without making lack part of processor architecture, fantasy a synonym for mythology, demand lack-free, jouissance a synonym for *Beseelung*, or private fantasy an object of constitutional rule. The primary cultural operationalization remains in *Mythology Construction*.
Life-drive–death-drive constitutional orientation	Lacan's intertwined life-drive and death-drive aspects, as culturally operationalized in *Mythology Construction*, with Edelman's explicit queer-theoretical use of death drive as a source bridge	Converts the vocabulary into independent ideal-typical constitutional poles asking what a shared order organizes motivation to reproduce. This social classifier, its definitions, and its limit-case judgments are Culture Mechanics proposals, not a constitutional axis formulated by Lacan or Edelman.
Ethical responsibility–perverse instrumentality contrast	Žižek's reading of Lacan in *How to Read Lacan*, including Bouyeri, bin Laden, Bush, fundamentalism, and Sophia Karpai	Preserves Žižek's opposition between acting as the instrument of a directly knowable big Other and an ethical act that refuses such exculpation. Its linkage to the project's drive orientation, fundamentalist form, fanatic-offspring diagnostic, accountable generativity, and democratic responsibility is a Culture Mechanics synthesis.

25. Newly proposed terms and formulations

The following are proposed within the coordinated theory project. Some originate in the preceding entries and are applied rather than redefined here. They should not be attributed to Durkheim, Lacan, Bellah, Rauch, Kuran, Havel, Solzhenitsyn, Arendt, Wedeen, Habermas, or van Eemeren and Grootendorst unless a later independent source establishes otherwise:

- **epistemic constitution of lifted mechanical solidarity** in the exact sense defined here;
- **contrast-amplified residual salience** as the conditional divergence in which remaining cases become more publicly prominent against an improving background, together with the definition, denominator, incidence, observation-intensity, historical-baseline, attention-to-incidence, residual-contrast, and correction audit; the project term is narrower than Davies's proposed "Spencer's Law" and is not a universal inverse-incidence theorem;
- **first-order full capture**, **lifted full capture**, the distinction between shared answers and a shared answer generator, and **universal jurisdiction over the allocation and limitation of first-order outputs and jurisdictions**, inherited from the coordinated theory project and applied constitutionally here;
- **reality-anchored, truth-seeking epistemic constitution**;
- the **me–we–world correction relation** and its linked propositions **removing the me may reveal the we, not yet the world** and **objectivity is a collectively sustained capacity to let the collective's own frame lose when the world answers against it**;
- the **culture-propagator correction projection**, **feedback-boundary congruence**, **endogenous confirmation**,

independent correction remainder, and **performative historical self-concealment** as project-developed relations among worldly consequence, sensing, observation, correction, co-authorship, jurisdiction, memory, and performatively altered social conditions; the religious symmetry boundary test applies the existing separation of causal efficacy from epistemic truth rather than classifying either compared religion;

- the **open reality–person circuit**, **World interruption**, **You interruption**, **DCL–Me closure**, and **DCL–We closure** as distinct project formulations joining operative relationship mode, cognitive stance, institutional enactment, consequence, personal standing, and revision without postulating additional processors; **world-detachability**, the return-obligation maxim, the multi-route closure audit, and the World–You–I diagnostic are project-developed controls within that circuit;
- the bounded desk-perpetrator formulation in which intact cognition and reflection operate under captured We-mode without an effective personal return path; this is a Culture Mechanics mechanism proposal rather than a complete exegesis of Arendt's banality of evil or a whole historical explanation;
- **tragic protective responsibility**, its visible-dirty-hands maxim, and the **moral-outsourcing** configuration as project terms separating burdened, answerable protection from exculpated perverse instrumentality; Ilyin's 1925 *On Resistance to Evil by Force* supplies the named philosophical application, while the protector-motif table, Davidic sequence, *Sündenesser* distinction, atonement boundary, and force-versus-sacralized-violence synthesis are project interpretations that retain the cited biblical countertexts and do not license force generally;
- ***Bewährung* through corrigible reality contact** as correction-tested robustness rather than duration or survival alone, with "wir irren uns empor" naming a fallibilist direction rather than guaranteed, monotonic, morally sufficient, or final progress;
- **open epistemic atmosphere**, **epistemic fog**, and **self-sealing epistemic enclosure** as distinct domain-sensitive correction conditions of the distributed epistemic milieu rather than processors, chronological stages, or automatic diagnoses of falsehood, intent, un-reason, or un-reality;
- **systemic-lying epistemic constitution** as the constitutional meta-order that recurrently generates, selects, authorizes, protects, and replaces organized un-reality because independent truth has been subordinated to usefulness, loyalty, control, or authority;
- **constitutional classification orientation** and **pole** as the extensible multi-orientation classification structure defined here;
- **sacred-principal allocation** as a candidate non-scalar audit retained outside the orientation table pending adequate poles, evidence, boundary classifications, and demonstrated independence from existing constructs;
- the originating user's selected name **life-drive–death-drive constitutional orientation**, with the project-developed definitions of **life-drive pole** and **death-drive pole** at constitutional scale;
- **generative orientation**, **positive-good orientation**, **world-building orientation**, and **flourishing-directed orientation** as approximate life-drive glosses rather than exact synonyms;
- **self-reproducing negation**, **adversary-dependent orientation**, **renewable conflict**, **permanent activated antagonism**, and **self-consuming repetition** as approximate death-drive glosses at distinct explanatory levels;
- **constitutive adversary** as a load-bearing identity and motivational structure, **antagonistic over-coupling** as an interaction mechanism, and **conflict-being** as a candidate name for a possible emergent result;
- **Ragnarök trajectory** as the originating user's selected name for a death-drive temporal path in which successful reproduction advances terminal rupture and possible self-extinction; the canonical definition and two-route typology are project-developed;
- **Edelmanian queer pole** as project shorthand for the particular anti-futurist and death-drive theoretical strand in *No Future*, not Edelman's term and not a classification of queer people or queer theory generally;
- **public epistemic telemetry**;
- the **theoretical *un-* family** for internal deformation beyond simple absence or opposition; **constitutive-relation inversion** as the direct relational morphology in which X's characteristic operation remains while the direction of answerability that constitutes X is reversed; and **pseudomorphic governor substitution** as the thicker bearer-level morphology in which a durable role, practice, procedure, office, profession, organization, or institution retains X's recognizable form, machinery, and authority while an incompatible principle governs choice, correction, and reproduction or succession. The originating author rejected *un-deformation* as redundant, selected *pseudomorphic governor substitution* from the assistant's candidates, and supplied the concern with trace-poor practices, hunches, compulsory transfer, and institutional capability challenges. The later author–assistant exchange distinguished relation-level inversion from durable bearer-level substitution and rejected applying the institutional detector wholesale to un-reason and un-reality. The assistant formalized the two-morphology taxonomy, shared family gate, retained-skin image, process–result distinction, collision and succession tests, vulnerability profile, and typed detector modules. Kant's infinite judgment supplies a disputed formal third-domain precedent, Freud's *unheimlich* internal estrangement of the familiar, Žižek's *undead/inhuman* contrast an immanent excess or distortion, and mineralogical pseudomorphism

the controlled retained-form image. Merton, Selznick, Michels, Meyer and Rowan, Brunsson, Lessig, Stigler, Andrews–Pritchett–Woolcock, Campbell, and Feynman supply neighbouring organizational mechanisms rather than the complete project synthesis. Campbell's replication, reanalysis, and minority-report disciplines; Feynman's invalidation disclosure, rival-cause, publication, and replication norms; Andrews–Pritchett–Woolcock's problem-driven iterative adaptation; and Lessig's proper-dependence audit are source-grounded neighbours. Their integration with the project's governor, trace, collision, sacrifice, correction, succession, and response architecture remains a Culture Mechanics development;

- **bounded-mechanism deformation**, **precondition blindness**, and **jurisdictional contraction under failure** as project-developed constitutional tests separating a real mechanism, its master signifier, and the programme acting in its name;
- **question-space governance**, its five-operation decomposition, **appealability** in the defined constitutional sense, **participation-to-mastery inversion**, **reality-matrix divergence**, and the living-symbol / dead-formula / idolized-answer-symbol distinction together with the compactness–differentiation comparison rule as Culture Mechanics operationalizations around Voegelin's source vocabulary;
- **foundational-question custody** as the project rule that conclusions remain joined to originating questions, experience, rivals, causal record, defeated errors, reopening conditions, and enough operation-bearing material for later generational reconstruction;
- **meaning-infrastructure counterpower** and the **science–prophecy and synthesis-authority boundary** as project-developed constitutional applications;
- **un-reason** as the project-specific cross-scale mechanism in which reasoning remains active and retains reason's machinery and authority-claim while conclusion-protection displaces truth-correction as governor. The assistant proposed the term during the discussion of Žižek's Night passage and the originating author selected it for integration. The term and mechanism are not attributed to Žižek or Hegel;
- **un-real representation**, **un-reality**, and **organized un-reality** as the project-specific state/output family in which socially authorized reality-status remains operative while independent correction loses the power to change authority or use. The originating author proposed extending the theoretical *un-* construction from un-reason to un-reality and selected the expressive formula "A lie becomes un-real when everyone must inhabit it, and un-reason begins when intelligence is recruited to explain why the visible contradiction cannot count." The assistant separated state from mechanism and constitutional pole, rejected *not-reality* as one technical bucket, and added the broad-*lie*, practical-*everyone*, and inspectable-*visible* boundaries. These terms and relations are Culture Mechanics developments, not Žižek's, Hegel's, Arendt's, Andersen's, or Rauch's;
- the **typed epistemic architecture** separating communicative operation, communicative selection orientation, inferential mechanism, operative state, installed stock, and constitutional meta-order. Its integration of linguistic tricks, instrumental untruthfulness, un-reason, un-real representation, organized un-reality, and systemic lying—together with the six-question classification discipline and systematic/systemic-lying boundary—is a Culture Mechanics synthesis;
- **post-disclosure un-reality**, **defeated-but-operative un-reality**, **acknowledged un-reality**, **correction nullification**, **dead-letter correction**, and **bounded de-authorization** as the project-developed distinctions separating public speakability, independent defeat, institutional reception, answerability, operative uptake, and repair. The originating user distinguished Andersen's acknowledging emperor from a carrier who refuses acknowledgment while a surrounding field continues the defeated operation; the assistant proposed the receiving-side mechanism, correction pipeline, and bounded jurisdictional response, and the user selected them for integration. **Procession inertia** remains the controlled Andersen-derived image for acknowledged continuation; the new terms are not Andersen's, Lacan's, Havel's, Solzhenitsyn's, Wedeen's, or Arendt's;
- the four-stage **corrective input → independently sustained epistemic correction → reception, answer, and adjudication → operative revision and repair** vocabulary, together with **performative impunity**, **epistemic humiliation**, and **civil humiliation**, as project-developed refinements of correction nullification. The actor-interface mechanism itself is defined as selective civil-personhood breakdown in 0010; applying it here does not attribute the compound political mechanism to Strawson or Szanto. The **distributed answerability-realization profile** and private-assent–operative-compliance distinction are project-developed projections joining the existing distributed-carrier and public-telemetry architecture to correction nullification. Brunsson supplies the neighbouring organized-hypocrisy relation among talk, formal decision, and action; the **compensatory-undertaking hypothesis** is the project's bounded application and must not be attributed to Brunsson beyond the source-supported relation;
- **procedural correction conversion** as the project-developed mechanism in which a correction is validly received, recorded, and perhaps accurately counted while a threshold, default, timing, agenda, quorum, routing, expiry, or restart rule converts it into no operative defeat. The August 2026 Chat-control discussion supplied the majority-to-threshold application and the distinction between observable conversion and the stronger *Verfahrenstrick* attribution; the generic mechanism, operator inventory, and boundary against legitimate stable heightened

thresholds are Culture Mechanics developments;

- **auxiliary un-real representation**, **adverse auxiliary un-real representation**, **auxiliary-un-reality explaining-away cascade**, and **counterfeit Bayesian updating** as the project-developed recursive mechanism in which reality contact threatening an operative U0 elicits an authorized U1 that explains the correction away, protects U0, and may itself acquire practical jurisdiction. The Bayesian relation is a controlled diagnostic contrast, not a claim that the field computes explicit probabilities or that legitimate independently evidenced alternative causes are un-real;
- the **un-reason–Babelization bridge**, the formulation **the shared real world remains causally common but ceases to be epistemically common**, and the **reality-correction-interface probe**. The originating user asked whether un-reason reaches the Babelization core when the shared real world is denied as the final mediator; the assistant developed the threshold distinction and practical dialogue protocol, and the user selected that synthesis for theory integration. A later discussion of Dushan Wegner's "Sinnkrise" identified the upstream semantic problem in which words and debate can retain recognizable form and social force while a protected conclusion controls what they may mean and what correction may do. The user recovered Roland Baader's "Marsch durch die Definitionen" aphorism; source verification located the exact sentence and its semantic-hollowing, failed-understanding, Newspeak, and Babel context in *totgedacht* (2002), pp. 127–128. Follow-up verification found the immediately preceding "Verrat der Intellektuellen" section, pp. 124–126, which explicitly treats Benda and connects moral immunization against facts and the political use of intellectual authority to the subsequent semantic method. The typed route from persuasive redefinition through possible un-reason, un-reality, semantic decoupling, and bearer-level substitution is a Culture Mechanics integration rather than Baader's taxonomy. The provisional labels *un-meaning*, *un-sense*, and *un-discourse* were considered but are not promoted here as canonical terms. The user then sharpened the political endpoint into the **secession-or-force thesis** and identified power deciding valid claims, standards, rights, and exceptions as the point where reason-mediated adjudication becomes power-mediated settlement. The user further identified secession as the only exit from the political-overpowering loop and preferred a soft form because it more easily leaves the door to reunion open. In a later correction, the user reserved *Machtpolitik* for the stricter composite of a power-seeking beneficiary, captured or exploited ideological power, Culture Mechanics, Cipollan-stupid carrier conduct, and systemic lying; open domination without systemic lying is therefore outside that category. The detailed fork and strict type belong to *Culture Program Ecology*;
- the **Benda truth–utility bridge** as the project-specific placement of Benda's source-attested contrast between useful error and harmful truth inside the truth orientation. The current discussion recovered the fuller Benda material from the psychology corpus and connected it to systemic lying, *Machtpolitik*, un-reason, double standards, and doublethink. The assistant initially formulated mutual enablement without entailment; the user corrected the project relation so that ***Machtpolitik* entails systemic lying**, with systemic lying still insufficient by itself, and selected truth-preserving culture as a central roadblock. The user then related Benda's *clerc* to the existing trusted-opinion-leader function and supplied Fraenkel's dual-state distinction as a further bridge to *Willkür*. Source verification corrected the supplied "largely a *Rechtsstaat*" compression: the retained *Normenstaat* was subordinate to a politically activated *Maßnahmenstaat*. The typed relationships, transmission mapping, pathway, and countermeasure are Culture Mechanics syntheses, not Benda's or Fraenkel's formal constitutional classifiers;
- **public avowal integrity** as defined here;
- **authority-gated belief updating** and **reality-permission**, inherited from *Epistemic Agency under Mechanical Solidarity* and applied at constitutional scale here;
- **disagreement sensor** and **public contestability infrastructure**;
- **constitutional scripts** as the role-, institution-, and situation-specific implementations through which a lifted epistemic meta-order becomes executable, developed from the coordinated theory's situated-cultural-script construct;
- **permanent contestability, not permanent contest** as the constitutional steady-state formulation;
- **finite operational demand** and **renewable epistemic demand**, inherited from and applied with the distinctions in *Mythology Construction*;
- **epistemic stewardship** and **responsible amplification**;
- **verify, qualify, or withhold** as the stewardship formula;
- **claim-resolution discipline** and **localized uncertainty** as the rule that uncertainty qualifies the proposition and resolution to which it applies, preserving supported coarser claims while withholding unsupported finer reconstruction, attribution, or authorization;
- **censorship sentinel** and **non-localizing epistemic-constitutional fault sentinel** as the project-developed application of the fault-detection versus localization-and-diagnosis distinction to correction-bearing speech. The originating user introduced the earnings-style summary-metric problem, selected fault detection without fault isolation or diagnosis, applied it to censorship, and selected the fire-alarm comparison to express strong

detection with weak localization. Fault-management terminology and the NIST omnibus-test description supply controlled external precedents, not a validated social likelihood ratio;

- **bootstrap illegality** and **legality laundering** as project names for the circular operation in which suppression first manufactures a speech category's unlawfulness and then treats that produced status as independent justification. The originating user supplied the decisive correction that "lawful speech" cannot be the anchor because introducing speech law is how the censor makes the targeted speech unlawful;
- the maxim **no person or institution receives root access to reality**;
- **anti-gnostic adaptive constitutional learning**, **dumb public kernel**, and the division among proposal, sensing, decision, implementation, aggregation, audit, adjudication, and correction;
- the combined tension-space model joining all of these concepts.

26. Scope cautions

1. **The framework is not anti-institutional.** Modern knowledge requires institutions and rational epistemic dependence. The pathology is monopoly, opacity, spillover, preemption, synchronized error, and resistance to correction.
2. **It is not epistemic individualism.** Personal checking is proportionate and domain-sensitive. Elementary verification supplements rather than abolishes expertise.
3. **It does not identify sincerity with truth.** Honest error remains error; correct conformity remains socially fragile if nobody may express why they disagree.
4. **It does not identify consensus with truth.** Consensus can be evidence when expression is free and routes are independent; it can be manufactured telemetry when expression is pressured.
5. **It does not identify disagreement with truth.** Contrarianism may be governed by a closed or preemptive successor authority. Rivalry alone is not the defect; disagreement initiates examination but does not settle it.
6. **It does not authorize a ministry of truth.** Reality-anchoring denies final epistemic sovereignty to every institution, including institutions established in the name of truth.
7. **It does not treat every social construction as false.** Law, money, office, promise, jurisdiction, and dignity are socially constituted yet real in their operation. Empirical assertions about them and their consequences remain testable.
8. **It does not require certainty before action.** Decisions under uncertainty still consider probability, severity, justice, reversibility, and the costs of action and inaction.
9. **It does not assume deliberate conspiracy.** Systemic lying can emerge through sincere belief, conformity, dependency, attention dynamics, and institutional self-protection, although it can also be strategically exploited.
10. **It is not a partisan classification.** The same criteria apply to governments and dissidents, majorities and minorities, scientific institutions and countercultures, religious and secular communities, allies and opponents.
11. **It does not depend upon the strongest collective-mind claims of culture mechanics.** The constitutional distinction can be applied by inspecting authority, avowal, evidence, disagreement, attention, memory, and correction even if the operative multi-mind-self threshold, privileged programming topology, or physical field analogies remain disputed.
12. **It does not define lifting as pluralism.** A lifted order is defined by its shared answer generator. That generator may have universal jurisdiction and produce plural, domain-limited authorities; universal meta-jurisdiction is not epistemic sovereignty because no representative may determine what reality is permitted to be.
13. **It does not require continuous adversarial mobilization.** Contestability must remain effective, but truth-directed convergence, accepted decisions, and low-conflict steady states are legitimate possibilities. Whether unused safeguards atrophy is retained as an open empirical and institutional-design question.
14. **It does not infer a complete pathology from a censorship sentinel.** A sentinel can strongly establish correction-system impairment while leaving the protected object, program, mechanism, scale, intent, and attribution open. Conversely, calling suppression legal, protective, anti-terrorist, safe, or child-protective cannot establish its own reciprocal-right nexus. Nor does accurate vote counting or formal receipt defeat a procedural-correction-conversion diagnosis; conversely, one heightened threshold does not establish manipulation, strategic selection, or a failed constitution.
15. **It does not constitutionalize private fantasy.** Fantasy becomes relevant here only when its public enactment organizes claims, attention, accusation, authority, sanction, or jurisdiction against correction.
16. **It does not identify constitutional text with constitutional operation.** Written principles can survive after their scripts lose carriers, interfaces, honour, independence, or practical support; a defective local script also does not by itself refute the general meta-rule.
17. **It does not make SGD a literal political algorithm.** The comparison licenses iterative correction, not one stable social loss function, gradient, parameter space, or guarantee of convergence.
18. **It does not make a scorecard sovereign.** Composite indicators remain constructed proxies whose dimensions,

weights, data, aggregation, and interpretation must be independently contestable.

19. **It does not make a dumb kernel self-executing.** Legible rules still require culturally formed carriers, viable roles, independent interfaces, records, enforcement, correction, and succession.
20. **It does not reduce life-drive to biological reproduction or death-drive to a wish to die.** A non-reproductive life can build, love, repair, teach, and transmit; a pronatalist order can lie, oppress, or destroy. Conflict, criticism, aggression, and difficulty do not establish death-drive without a self-renewing circuit that displaces its purpose or consumes its carriers.
21. **It does not classify a population from one theorist's programme.** Edelmanian queer negativity is a bounded, source-attested doctrinal limit case. It is not homosexuality, queer people, queer theory generally, or every anti-normative criticism.
22. **It does not make drive orientation a sovereign social-good metric.** The poles organize diagnosis and hypothesis generation; they do not grant an interpreter authority to define every person's flourishing or to aggregate heterogeneous goods and mechanisms into one calibrated score.
23. **It does not infer life-drive from reproduction or death-drive from collapse.** Teaching, maintenance, and transmission take their drive valence from the trajectory they serve. A Ragnarök trajectory requires evidence that propagation advances terminal logic and consumes its substrate; catastrophe or eventual programme failure alone is insufficient.
24. **It does not equate Night, not-reason, anti-reason, and un-reason.** Subjective Night is a constitutive and potentially generative inward ground; not-reason is the absence or non-operation of reasoning; anti-reason is a broad directional opposition; un-reason is reasoning internally organized against its own correction conditions.
25. **It does not diagnose un-reason from sophistication, contradiction, or affiliation alone.** The claim requires a specified unit and pattern of protected conclusions, asymmetric standards, recursive immunization, and failed independent correction. It does not establish motive, intelligence, pathology, or population membership.
26. **It does not equate un-reason with Babelization or failed persuasion.** Localized un-reason may close joint inquiry around one protected claim while language, coordination, and other correction routes remain available. Babelization requires the further scale and threshold evidence that shared translation, legitimate common procedure, and necessary coordination have fallen below the anti-Babel floor.
27. **It does not infer secession or *Machtpolitik* from disagreement alone.** The secession-or-force fork additionally requires an unavoidable binding output, incompatible answers, and failed mutually legitimate adjudication. Ordinary enforceable law remains distinct from power determining which reasons and rules are valid; that latter operation is open domination and still does not establish *Machtpolitik* without the strict composite gate.
28. **It does not infer doublethink from one contradiction or equate its source senses.** Contextual differences, uncertainty, development over time, and ordinary inconsistency can produce apparently incompatible statements. Petrović and Žeželj's individual-differences measure does not by itself establish Orwellian political training, un-reason, systemic lying, or motive.
29. **It does not equate systemic lying with *Machtpolitik*.** The Benda bridge specifies one-way necessity, not identity: *Machtpolitik* entails a systemic-lying core, but distributed organized un-reality can exist without a power-seeking beneficiary, ideological-power exploitation, culture-mechanical mobilization, or bandit–carrier payoff asymmetry. Openly avowed domination without systemic lying is open authoritarianism or naked domination rather than *Machtpolitik* in the project's strict usage.
30. **It does not equate Benda's *clerc* with trusted opinion leadership or capture.** A *clerc* is a source-attested intellectual-vocation role; trusted opinion leader is a project-developed receiving-field function; covert capture is a further causal diagnosis. The roles can overlap without any of these classifications entailing the others.
31. **It does not infer *Rechtsstaat* from Fraenkelian *Normenstaat*.** A *Normenstaat* may preserve extensive legal regularity while a *Maßnahmenstaat* can remove politically selected cases from effective guarantees. Nor does the dual-state topology alone establish systemic lying, *Machtpolitik*, or *Willkürherrschaft*.
32. **The Grail question is a probe, not a verdict.** Capability, efficiency, abundance, technological danger, or competitive escalation does not by itself establish life-drive, death-drive, destructive sublimation, un-reason, conspiracy, a conscious machine, one beneficiary, or a Ragnarök trajectory. Declared purpose, effective beneficiaries, objective dynamics, sacrificed goods, mastery relations, correction, and temporal trajectory require separate evidence.
33. **Un-reality is not a synonym for fiction, simulation, nonexistence, error, or falsity.** It classifies the relation among authorized representation, practical reality-status, participation, and failed correction. True content can be held un-really; false content can remain corrigible.
34. **Un-reality is not automatically un-reason, systemic lying, Babelization, or conscious deception.** Specify the representation, domain, institution, participation surface, period, operative allocations, correction route, and response to defeat. The stronger neighbouring constructs retain their own mechanism, scale, and threshold

evidence.

35. **Speakability is not yet operative correction.** Public contradiction may break apparent consensus while authority, resources, procedure, and conduct continue unchanged. Test whether disclosure alters practice rather than treating one true utterance, witness, dissident, or exposure as automatic institutional repair.
36. **Correction nullification is not established by non-agreement or one unanswered claim.** Establish the correction independently, specify the authorized receiving and decision path, distinguish reasonable investigation or implementation time from stonewalling, and test whether non-response actually preserves operative authority. The mechanism alone proves neither one bad actor, a coordinated choir, intent, systemic lying, nor Babelization.
37. **Bounded de-authorization is not conversion or civil annihilation.** It withdraws only the evidenced representation's or carrier-function's specified authority through lawful, proportionate, reviewable procedure while preserving person-standing, speech, belief, association, due process, appeal, and authorities outside the demonstrated nexus.
38. **Not every downstream non-change defeats correction.** A true correction may be immaterial to a particular office, remedy, allocation, or person. The test is whether it can alter the operations whose justification materially depends upon it, with reasons and review available when no change follows.
39. **Not every alternative explanation is auxiliary un-reality.** Legitimate causal inquiry compares independently evidenced alternatives under reciprocal tests. The explaining-away cascade requires operative U0, reality contact that threatens it, inadequately supported or asymmetrically protected U1, authorization, blocked correction, and practical consequence.
40. **An adverse attribution is not evidence of counterfeit updating by itself.** Sabotage, resistance, bias, error, or third-party causation can be real. Test provenance, timing, causal adequacy, independent support, reciprocal standards, predictive exposure, and whether the account can lose.

Final semantic summary

- **Broader class:** society-wide epistemic and cultural meta-order.
- **Central object:** the relationship among reality, private judgment, public avowal, authority, evidence, disagreement, attention, memory, correction, and what the shared order organizes motivation to reproduce.
- **Me–we–world correction relation:** removing private or factional privilege can reveal a conscientiously applied shared framework without establishing that the framework fits the world. Objectivity requires correction paths through which shared operations and mind-independent consequences can revise both answer and inherited epistemic grammar. Aquinas's *adaequatio intellectus et rei* names the world-facing correspondence criterion, while Durkheim's own distinction between harmony among minds and harmony with things supplies the social-epistemic bridge to objective adequacy; collective persistence remains evidence to explain rather than proof of world-fit, and Rousseauian cancellation cannot remove a frame common to all participants.
- **Durkheim–Rousseau non-equivalence:** Durkheimian collective concepts are a diachronically accumulated, organized, and distributed conceptual inheritance that can exceed the knowledge of an average present member; Rousseauian cancellation concerns present private differences under a political decision procedure, while the related center-of-gravity image is the project's non-arithmetic picture of a common frame or attractor. Neither operation establishes world-fit.
- ***Bewährung* through corrigible reality contact:** duration creates testing opportunities but warrants additional confidence only where varied exposure, resistant consequences, preserved adverse records, affected-person standing, rival comparison, and effective revision or abandonment allowed the account to lose. "Wir irren uns empor" names error-driven cumulative learning rather than automatic progress; correction-tested robustness remains defeasible evidence and cannot by itself establish final truth or moral legitimacy.
- **Mediation without epistemic sovereignty:** shared reality is both a common domain through which culturally differently formed persons can build compatible concepts and an independent source of correction when those concepts fail. Socially mediated access does not make the frame sovereign over what its objects may do; successful affordance and resistant failure are evidence to interpret rather than self-explaining truth or moral oracles.
- **Felt-impartiality boundary:** removal of private advantage, visible command, or hot collar pressure can leave a locally formed epistemic grammar untouched. "Our trained community reasons this way" may consequently be experienced as "reason itself works this way." Genealogy, deconstruction, and regime-of-truth inquiry can expose that formation without thereby refuting the answer or establishing relativism; world-directed correction remains a separate test.
- **Distributed-milieu correction conditions:** an open epistemic atmosphere makes anomalies, rival operations, and revision usable; epistemic fog makes a relation difficult to form or share without necessarily protecting an answer; self-sealing epistemic enclosure lets a protected construction govern why correction cannot count. Across milieus, fog can raise translation costs and enclosure can preclassify a rival correction as invalid, but

either becomes Babelization only when loss of translation, legitimate procedure, or required coordination crosses the anti-Babel threshold at a specified interface.

- **Theoretical *un-* family:** a theoretical *un-X* marks internal deformation beyond simple absence or external opposition; it is not a general rule for every word beginning with *un-*.
- **Constitutive-relation inversion:** the direct relational morphology in which X's characteristic operations remain active while an output, commitment, or authorized representation controls the inputs or correctors to which it should answer. Un-reason is its inferential-mechanism application and un-reality its socially operative state application; neither requires one bounded institution.
- **Pseudomorphic governor substitution:** the thicker bearer-level morphology in which a durable role, practice, procedure, office, profession, organization, or institution retains recognizable X-form, machinery, and authority while an incompatible governor controls consequential choice, correction, and reproduction or succession. The process yields a functional pseudomorph of X and is best detected in collision cases, matched comparisons, correction, transfer, and succession rather than from routine output or private-intent inference alone.
- **Voegelinian existential layer:** truth and untruth of existence concern the operative relation to finite participation in reality; a Second Reality is a protected interpretive construction that governs what experience may signify. Question-space governance, appealability, participation-to-mastery inversion, symbol states, and reality-matrix divergence operationalize that layer without collapsing it into un-reason, un-reality, or Babelization.
- **Bounded-mechanism correction:** a real mechanism, its positively charged signifier, and the institutional programme acting in its name remain distinct. A corrigible order permits evidence to restore preconditions, contract jurisdiction, change custody, or retire the programme after failure.
- **Foundational-question custody:** living inherited knowledge preserves the originating question, experience, serious rivals, causal record, defeated errors, and reopening conditions rather than transmitting one detached answer.
- **Meaning and synthesis limits:** concentrated educational, classificatory, credentialing, interpretive, and public-mediation power requires counterpower; empirical office must mark its transition into value synthesis, prophecy, and political authorization.
- **Typed epistemic architecture:** linguistic trick, instrumental untruthfulness, un-reason, un-real representation, organized un-reality, and systemic lying identify respectively a communicative operation, selection orientation, inferential mechanism, operative state, installed stock, and constitutional meta-order. None is a synonym or automatic proof of the next.
- **Distributed carrier sequence:** originator or selector, carrier, and recipient reconstruction are separate communicative positions that may connect to possible un-reason, un-reality, organized un-reality, and systemic lying. Different participants can occupy each function; intent does not propagate with a message, distributed reproduction does not establish conspiracy, and every arrow requires separate evidence. The distributed answerability-realization profile applies that architecture to correction nullification: sincere believers, rationalizers, private doubters, role-obedient transmitters, trusted carriers, and institutional custodians can perform complementary functions without sharing private belief or one design.
- **Internal failure mechanism:** un-reason can preserve sophisticated reasoning while conclusion-protection displaces truth-correction as the governor of its concepts, burdens, exceptions, and recursive interpretations; it is not a third orientation. Doublethink is a narrower possible component in which incompatible authorized beliefs cease to correct one another; neither one contradiction nor an individual-differences score establishes it politically.
- **Cross-scale truth-orientation state:** an un-real representation retains operative public reality-status while observation, prediction, consequence, and dissent cannot reliably change its authority or use. Organized un-reality is the stronger multi-channel state reproduced by the systemic-lying pole; neither ordinary error nor fiction establishes it. After disclosure, acknowledged continuation can persist through procession inertia, while an unacknowledged defeated account can persist through correction nullification; bounded de-authorization removes specified operative authority without requiring conversion or whole-person defeat.
- **Staged correction distinction:** un-reason neutralizes what a candidate correction means and can prevent counterevidence from becoming authoritative correction; correction nullification neutralizes what an independently sustained correction can do and can prevent correction from becoming consequence. Procedural correction conversion is the received-and-processed branch in which a decision rule transforms the adverse signal into no operative defeat. Any mechanism can occur without the others.
- **Selective-non-answerability route:** selective civil-personhood breakdown is an actor-interface route through which an officeholder can continue execution and defence while authorship, promise, contradiction, answerability, repair, and consequence fail to bind the role. It can combine with the Emperor route and produce performative impunity, epistemic humiliation, and civil humiliation without by itself establishing incapacity, intent, hidden command, or deliberate humiliation. Recovery requires an answerable route from record and

reception through independent adjudication to operative revision and repair.

- **Recursive defensive mechanism:** an auxiliary-un-reality explaining-away cascade adds an authorized U1 when reality contact threatens operative U0; trusted carriers may route U1, correction nullification may preserve operation, systemic lying may generate further auxiliaries, and organized un-reality is the accumulating stock. Legitimate causal alternatives remain outside the mechanism when independently supported, inspectable, predictively exposed, and reciprocally corrigible. Counterfeit Bayesian updating begins only when authorization, identity fit, or programme utility substitutes for that independent support while the auxiliary account is protected from losing.
- **Candidate allocation audit, not a third orientation:** sacred-principal allocation asks who or what receives ultimate standing and who becomes its instrument. Its governing question may be independent, but its poles, mixed-principal boundary cases, and added value beyond service direction and subjecthood absorption remain insufficiently specified.
- **Truth–power bridge:** Benda supplies one source-attested pathway in which clerc-like authority converts political usefulness into apparent moral and epistemic validity, honouring useful error and shaming harmful truth. *Machtpolitik* definitionally requires the resulting systemic-lying core, but systemic lying alone does not establish *Machtpolitik*.
- ***Clerc*–trusted-opinion-leader bridge:** Benda's source-attested intellectual-vocation role can overlap with the project's receiving-field function, giving moral and epistemic authorization privileged routing and cascade. The terms are not synonyms, and neither establishes betrayal or capture.
- **Legal-override bridge:** Fraenkel's *Doppelstaat* shows how a *Normenstaat* can preserve extensive legal regularity while a *Maßnahmenstaat* withdraws politically selected cases from effective guarantees. This can support systemic lying but does not by itself establish that orientation, *Machtpolitik*, or *Willkürherrschaft*.
- **Preventive truth culture:** truth-preserving culture keeps harmful truth speakable, useful error rejectable, standards reciprocal, records durable, and independent correction effective. It therefore blocks a necessary component of *Machtpolitik* while operative, but does not by itself prevent openly avowed authoritarian force.
- **Interoperability bridge:** localized un-reason can make the shared real world causally common but no longer epistemically common for one protected claim. It contributes to Babelization only when the failure spreads across central meanings and adjudication routes far enough to produce intergroup semantic decoupling and cross the anti-Babel floor.
- **Political fork:** where severe Babelization meets an unavoidable binding decision, the remaining structural branches are jurisdictional separation or imposed settlement. Separation is the only exit that does not require one programme to overpower the other; a soft form can preserve the possibility of restored interoperability and voluntary reunion. Power becoming the judge of valid reasons and rules is open domination; it becomes *Machtpolitik* only when the stricter composite classification gate is also satisfied.
- **Social form:** lifted mechanical solidarity—shared rules for generating, selecting, applying, and revising concrete answers—constituting and correcting a common order across organic differentiation.
- **Society-wide performance:** operative lifted solidarity can support cultural interoperability above the anti-Babel floor; thickness and span describe that performance without redefining the order level.
- **Independent person–collective question:** high interoperability does not establish subjecthood absorption (fusion), and differentiated unity does not require identical first-order answers.
- **Slot occupancy:** reality-anchored and systemic-lying constitutions are both full lifted captures; full occupancy does not decide epistemic quality.
- **Jurisdictional form:** the lifted generator can govern universally while constituting, allocating, limiting, coordinating, and governing the succession and correction of first-order outputs and jurisdictions.
- **Authority boundary:** persons and institutions remain plural and domain-limited beneath the meta-order and receive no root access to reality.
- **Core-theory interface:** local bigOthers communicate through a shared symbolic protocol and help maintain a mechanical-solidarity field and distributed bigOther; a multi-mind-self presentation or operative multi-mind-self is possible but neither is required.
- **Implementation:** formal institutions plus distributed constitutional scripts, cultural programming, incentives, language, habits, reciprocal social enforcement, and field back-action.
- **Optional motivational interface:** lack can supply an open gradient, desire continuing movement, and fantasy a desirable object and subject position; epistemic institutions then help route that motivation into finite, evidence-answerable demands or renewable, correction-resistant circuits.
- **Extensible classification structure:** a constitutional classification orientation asks one independent question of the shared order; its poles are ideal types. The present two orientations do not preclude later independent additions and must not be collapsed into one score.
- **Truth orientation:** reality-anchored truth-seeking $\leftrightarrow$ systemic lying.
- **Drive orientation:** life-drive $\leftrightarrow$ death-drive. Approximately, this contrasts generative positive-good orientation

with self-reproducing negation, adversary-dependence, renewable conflict, and self-consuming repetition; the glosses name different explanatory aspects rather than strict synonyms.

- **Service-direction probe:** Pageau's Grail question asks whom or what produced abundance and power serve. The project applies it by separating declared and effective beneficiaries, operative objectives, sacrificed substrates, mastery reversal, correction, and temporal trajectory; successful capability alone has no fixed drive valence.
- **Drive-source boundary:** the psychological operationalization remains in *Mythology Construction*; this document owns its application as a constitutional classifier. Lacan's intertwined drive aspects are not two literal substances.
- **Ragnarök trajectory:** one possible death-drive system path in which successful propagation makes a terminal organizing logic more capable until the containing order and possibly the programme itself lose continuity. Reproduction is therefore not inherently life-drive.
- **Closest explicit doctrinal limit case presently identified:** Edelmanian queer negativity in *No Future* approaches the death-drive pole through its self-described anti-futurity, refusal, negativity, jouissance, and death-drive vocabulary. This is a classification of one theoretical programme, not of homosexuality, queer people, or queer theory generally.
- **Genealogical boundary:** the deeper relation between revolutionary-left critical machinery and Edelmanian negativity is a candidate enabling pathway, not a demonstrated direct lineage, logical entailment, or classification of the wider left or queer theory.
- **Starting predicament:** unavoidable epistemic dependence.
- **Truth-orientation positive endpoint:** reality-anchored, truth-seeking epistemic constitution.
- **Truth-orientation negative endpoint:** systemic-lying epistemic constitution.
- **Positive central virtue:** piety toward the real.
- **Candidate adaptive form:** anti-gnostic constitutional learning through a person-protecting constraint shell, legible public kernel, plural proposals, differently vulnerable sensors, and separated correction.
- **Controller boundary:** SGD and scorecards are controlled analogies and instruments, not a social loss oracle or substitute for judgment.
- **Humanity boundary:** complete equal standing belongs to concrete persons; human possibility is an open horizon, not a collective agent whose alleged interest appoints interpreters or authorizes sacrifice.
- **Positive interpersonal condition:** sincere avowal without immunity from correction.
- **Positive public mechanism:** visible, equal, non-sovereign staging of consequential disagreement.
- **Correction-closure sentinel:** disabling nonviolent, evidence-bearing correction can strongly detect epistemic-constitutional malfunction while leaving fault localization, exact diagnosis, scale, and attribution open.
- **Legality boundary:** a censorial operation cannot manufacture illegality and then use that endogenous classification as independent constitutional justification; test reciprocal rights, symmetry, evidence, independent review, appeal, and repair.
- **Steady-state distinction:** permanent contestability, not permanent contest; low activated conflict can be compatible with an open order when correction and succession remain effective.
- **Dormant contestability:** opposition, appeal, investigation, legitimate-loss, succession, and correction scripts can remain inactive yet viable; written procedures without executable carriers and interfaces are merely nominal.
- **Positive individual virtue:** epistemic stewardship in amplification.
- **Resolution discipline:** existence, mechanism, magnitude or range, exact reconstruction, attribution, and authorization remain separate claim levels; uncertainty at one level neither erases independent support at another nor licenses an unsupported precise conclusion. Convergent evidence requires a dependency audit; negative findings require a relevant opportunity for detection; numerical comparisons require matching units, scope, intervals, denominators, and counting rules.
- **Central negative recursion:** conformity → apparent consensus → deference → knowledge corruption → deeper conformity.
- **Reconstruction-pipeline pathology:** systemic lying can govern selection, compression, trusted repetition, recipient decompression, and the admissibility of alternative reconstructions without requiring a consciously false sentence at every node.
- **Privileged-vision pathway:** doctrinal causal omission can hide the implementation layer while *Herrschaftsideologie* converts claimed superior access into jurisdiction and treats disagreement as evidence of incapacity; neither mechanism is necessary in every systemic-lying order.
- **Central institutional pathology:** authority-gated belief updating and self-protected correction failure.
- **Reflective implementation test:** an open constitution cultivates auditors capable of exposing rule, framing, provenance, authority, jurisdiction, and consequence, rather than only press secretaries for protected conclusions.

- **Micro-level mechanisms:** cross-referenced in *Linguistic Tricks: A Semantic Inventory*.
- **Governing truth question:** Does society's authorization provide corrigible routes toward reality, or does authorization determine what reality is permitted to be?
- **Governing drive question:** Does the shared order bind motivation into completable, maintainable, and transmissible goods, or into renewable negation and repetition whose continuation depends upon non-resolution?
